## INTRODUCTION

Population estimating in the United States is really population forecasting because the annual estimates are simply adjustments to the Census conducted by the U.S. Department of Commerce every ten years. J.E. Morton of the Upjohn Institute for Employment Research pointed out in On Manpower Forecasting that, "All forecasting efforts, by whichever method, have one element in common: the search for relative stabilities and invariances of relationship. However complex the resulting methods and models, their forecasting powers stand and fall with the validity of the assumed or implied invariance".

Since 1971 the State of Alaska has been preparing population estimates based on two widely used methodologies in which civilian in- or out-migration is determined to be proportional to cohort school enrollment fluctuations over time. In many areas of the nation school enrollment is the best indicator for population shifts because none can deny the relationship between increases in children attending public schools in an area and the corresponding total population increase.

In Alaska, however, this assumption of constancy can not be so easily made. According to the North Star Borough's "Pipeline Impact Information Center Report Number Thirteen" dated February 19, 1975, "During the one-month period from December 30, 1974 through February 1, 1975, Bechtel, Inc. processed 1,575 pipeline workers through the Fairbanks orientation center. Of those, 31 said they intend to bring their families, which include a total of 58 school-age children, to Fairbanks to live. These figures show that for every 26.5 pipeline workers hired during the current survey period, one school-age child would be brought into the local school system". There is no way to accommodate this relationship with the present estimating techniques used for the State in general and the North Star Borough in particular.

The art of population estimating today is in a state of flux. The Bureau of the Census has developed a technique by which administrative records from the Internal Revenue Service are being used to trace sub-country migration patterns. The Bureau has expressed enthusiastic confidence in this new method and hopes to eventually have it replace or at least substantially affect the Federal-State Co-op program estimates. Their work opens up many areas not previously considered available for statistical investigation.

The Research & Analysis Section of the Alaska Department of Labor is now examining alternative multiple regression variables which may more accurately reflect the migration patterns of our State. Coordination with other data collection agencies has begun in an effort to consider exactly what population indicators can meet Mr. Morton's definition for relationship invariance.

In order to affect officially accepted estimates of Alaska's population, any new methodology proposed must be approved by the Population Division of the Bureau of Census. This is one of the goals of our endeavor. The main goal is to develop the most accurate estimating technique for an atypical population of Alaska.

## METHODOLOGY

The methodology used for Alaska's July 1, 1974 census divisional estimates was basically the same one employed for the previous three annual estimates with one exception. The method involved (1) subtracting Armed Forces from the 1970 Census count to arrive at an estimate of the April 1, 1970 civilian population; (2) adding to this civilian population an estimate of births for the period between the census and the estimate date; (3) subtracting an estimate of civilian

deaths; (4) adding an estimate of net civilian migration, and (5) adding an estimate of the number of persons in the Armed Forces stationed in the State. The exception was that the practice of adjusting the derived estimates to Census Bureau control totals was discontinued.

The estimate of net civilian migration for each census division was prepared by the Census Bureau's Component Method II. The basic steps involved in the estimation of net civilian migration according to this method are as follows: (1) Net migration rates for children between exact age 6 1/4 and exact age 14 1/4 years at each estimate date were developed on the basis of the 1970 Census and statistics on school enrollment in grades one through eight. (2) These rates were multiplied by a factor to obtain the estimated migration rate for the total population suggested by the Bureau of Census based on the age structure of intercounty migrants. (3) The resulting rates were applied to the civilian population of all ages (adjusted by one-half the births since 1970) in each census division in 1970 to obtain tentative estimates of net civilian migration for the period since 1970.

#### SOURCES OF DATA

The data used to develop the population estimates contained in this publication were obtained from other State and Federal agencies. Vital statistics were supplied by the Alaska Department of Health and Social Services, Division of Statistical Services. School enrollment data were provided by the Alaska Department of Education and the Bureau of Indian Affairs. The Alaskan Command and United States Coast Guard supplied figures relating to the Armed Forces stationed in Alaska.

## INTRODUCTION

The estimates contained in this publication were prepared on a labor force basis, replacing previous estimates of work force. This major revision is intended to remove the effects of multiple job holding and commuting from the employment estimates, bringing the State and area data closer in concept to the national figures derived from the monthly Current Population Survey.

In work force employment estimates, workers were counted where they worked and were counted more than once if they were included on more than one payroll. By contrast, labor force employment figures reflect a place of residence location and count each employed person only once.

Nonagricultural wage and salary employment by industry is still being compiled and published in the same way it has in the past. Because these figures are useful in economic analyses, they will continue to provide a historically consistent series of industry employment by place of establishment.

There are two tables for each area.<sup>1/</sup> The first shows total civilian labor force, the two components of labor force, total employment and unemployment, and the unemployment rate. The unemployment rate is the percentage of the civilian labor force that is unemployed. The total employment figures include self-employed persons, unpaid family workers, domestics, agricultural workers, and workers directly involved in work stoppages, as well as nonfarm wage and salary employment adjusted for multiple job holding and commuting. The contents of this table are on a place of residence basis.

<sup>1/</sup> These labor areas correspond to the original twenty-four election districts defined in the State Constitution.

The second table shows nonagricultural wage and salary employment by place of establishment subdivided into major industry division.

The source of most of the employment data is the contribution reports filed quarterly by most employers in the State in compliance with the Alaska Employment Security Act as well as reports filed by federal agencies under the federal unemployment insurance program. State and local government employment was available from reports which these government units send to the Employment Security Division under the Current Employment Statistics program conducted in cooperation with the Bureau of Labor Statistics of the U.S. Department of Labor.

In certain categories of noncovered employment, employer sources of data do not exist on a continuous reporting basis. For these categories employment estimates were prepared from projections of the 1970 Census figures and from special surveys.

The techniques used in estimating unemployment and in adjusting establishment employment data to a place of residence basis are those prescribed by the Bureau of Labor Statistics. Unemployment estimates include all jobless persons looking for work, regardless of whether or not they qualify for unemployment insurance benefits.

All of the figures for individual labor areas are unrounded even where the figures are estimates. The decision to publish unrounded figures was dictated by convenience rather than confidence that the estimates are accurate to the one digit level. All figures for the State have been rounded to the nearest hundred.

VIII	Area Profiles	37
	A. Anchorage	37
	B. Fairbanks	40

# Introduction

From a historical perspective, this report is more than a preliminary review of "what happened" to the economy during 1975. Of greater importance, it attempts to capture the essence of a very basic and relatively rapid change in the economy, a movement from a somewhat underdeveloped, frontier stage to a more diversified, less dependent level of development. While the other 49 states' economies have in the past experienced similar growth, not even the gold and silver "booms" of the western states, the Yukon or even Alaska, had the massive short-term or substantial long-run effects which Alaska's current petroleum and other mineral industry expansion has had and is expected to have.

Also of significance was the growing awareness and frustration on the part of Alaskans as to the amount of influence the State may be able to exert as regards

the extent or direction of future development, etc.

The Performance Report has been expanded by the addition of a section on area economies. Included in this issue are brief analyses of Anchorage and Fairbanks. For the benefit of the many newcomers to the State, as well as for our readers to the south, a historical background of each community is provided.

Where the performance report indicates that problem areas are beginning to emerge, or continue within certain segments of the economy, i.e., fisheries, the staff of the Department of Commerce and Economic Development has added to some ideas that need to be pursued further in an attempt to solve these problems. It should be noted that these ideas do not indicate a coordinated State position.

As was true of previous year-end Performance Reports, it was necessary to rely upon partial-year data in analyzing economic

changes during 1975. More complete statistics and a more thorough analysis will be provided in the mid-1976 report. In particular, the availability of detailed information will then permit an examination of diversification of manufacturing and support industries.

In perusing this document, the reader should note the numerous sources credited for information included in the charts and tables. The Division of Economic Enterprise relies upon a multitude of governmental and private sources for primary and secondary data. Although the list of contributors is too lengthy to identify each one, we would like them to know that we are aware of and appreciate the special efforts which they make to provide us with information. A special thank you to each contributor.

As in the past, we welcome your suggestions as to improvements in this publication.

# Summary & Aggregate Performance Level

During 1975, the minerals industry played an even greater role in a second consecutive year of strong economic growth. Although the trans-Alaska oil pipeline construction project remained the primary, and certainly the most visible, instrument through which mining influenced the economy, the industry generated other important activities. The support industries, including trade and service, benefited considerably from the mineral-related development. Unfortunately, the forest products and commercial fisheries industries did not participate in the general uptrend; both experienced declining production and employment.

The construction industry enjoyed another boon year. In addition to the pipeline project, the petroleum companies contributed to the active pace of construction through investment in administrative, support, and production facilities from Anchorage to Prudhoe Bay. Residential and other commercial construction activity was also spurred by the population and economic growth

indirectly influenced by petroleum development. As was true in 1974, construction employment nearly doubled.

The mining industry clearly dominated the economy but primarily through the aforementioned impacts upon construction. Mining employment grew rapidly but still represented a smaller proportion of the labor force than, say, wholesale trade. However, expenditures on mineral exploration, hard rock as well as petroleum, rose by several magnitudes.

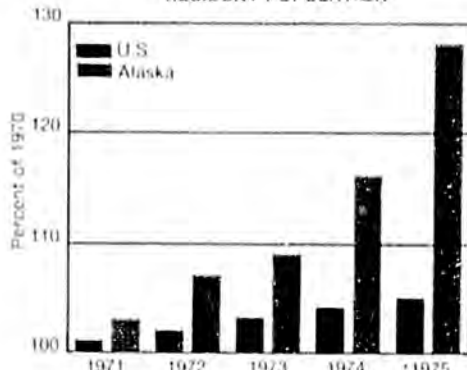

Continued recessionary conditions in both domestic and Japanese markets for lumber and pulp, coupled with high timber inventories, caused a marked downturn in the forest products industry. The timber harvest fell substantially. Appreciable declines also were recorded in the production of pulp, cants, and other lumber products.

Commercial fisheries endured a third successive year of mediocre catches; also prices for most seafood were somewhat lower. A disappointing State-wide harvest

of salmon resulted from especially poor returns in Southeastern, Kodiak, and Chignik regions. Marketing problems were encountered in the shellfish component of the industry.

Government expenditures and employment continued upward. The federal work force was expanded to administer and plan for outer continental shelf development and for improved land management. Expenditures exceeded \$1 billion in 1975 and are expected to be even higher in 1976. A modest growth in State Government employment took place in response to needs of a quickly accelerating population stimulated by oil related development. Even more substantial gains were noted in local government.

### Aggregate Indicators

Preliminary data for 1975 points to an even more remarkable expansion in employment and income than was recorded during the previous year. Civilian non-farm wage and salaried employment rose from 128,200 to approximately 155,200. At the same time, the labor force advanced to roughly 176,900 (+19 percent) and unemployment increased to 15,800 (+6 percent). The more substantial increase in employment brought a lower unemployment rate, down to an estimated 8.9 percent on an annual basis.

Alaska which historically has had the highest unemployment rate in the nation, slipped well below the high rate posted by almost one-half the other states including Arizona, California, Florida, Massachusetts, Michigan and New York. In fact, Alaska, for

the first time since labor force and unemployment statistics have been gathered, early in Territorial days, approached the national average unemployment rate.

Wage and salaried payments climbed to about \$3.1 billion in 1975 or more than double the 1973 level. Personal income grew from almost \$2.4 billion to \$3.5 billion since 1974, an annual increase of 46 percent. Output was also sharply higher; gross product posted an estimated 54 percent advance from 1974. During the past two years of dramatic growth, Alaskans endured unusually high inflation. The consumer price index (CPI) for Anchorage rose at nearly double the national rate in 1975. From January through October 1975, the Anchorage CPI advanced 10.0 percent, compared to 5.4 percent for the United States.

### Forecast

A marked slowing in the growth rate is anticipated for 1976, reflecting a downturn of greater-than-seasonal proportions in construction during the last quarter. More moderate economic growth is also foreseen for most other industries. Non-agricultural wage and salaried employment may increase by only about three percent to around 160,000. The limiting force will be construction where a low summer peak work force and heavy fall layoffs have been announced by Alyeska Pipeline Service Company. The company predicts a maximum employment of 18,000 on the pipeline project, including 13,000 on the line and 5,000 on pumping stations and the Valdez terminal. All 800 miles of pipe are expected to be laid by early fall, leaving only the terminal and pumping stations to be completed.

Manufacturing should recover as supply and demand conditions improve for the forest products and seafoods processing industries. The recovery in the U.S. economy plus an uptrend in Japanese housing starts portend a more favorable year for lumber, cants, and probably pulp. Fisheries should also fare better with the

economic improvement in the "lower 48" and a projected increase of roughly 30 percent in the salmon harvest.

The largest relative expansion is anticipated in mining. Employment should rise by ten percent, and possibly more. Substantial expenditures are forecast for mineral exploration, develop-

ment, and production. Leasing of federal OCS lands begins in 1976 and agents for the Native corporations are proceeding with petroleum and hard mineral exploration.

Growth rates for employment in most support industries and government have been estimated conservatively to range between four and seven percent.

# Significant Impending Economic Developments

There are two developments which in the near future will influence the economy in a manner similar to the impact of the trans-Alaska oil pipeline upon today's economy. One event is assured, the other problematical. Assured is the development and production of Outer Continental Shelf (OCS) petroleum and gas reserves. In question is, if approval will be obtained for a trans-Alaska gas line, which is necessary before a petrochemical industry can occur. The Alaska route pends decision determined by factors outside the market economy or the State. When and if the two economic events occur, they will shape the direction of the Alaskan economy for the remainder of this decade and the next.

## Outer Continental Shelf Petroleum Development

The Federal Government announced an OCS leasing schedule in 1975 listing nine major shelf sales for Alaska between 1976 and 1978. The State also announced a lease sale in State tidewaters in the Beaufort Sea. Together these lease areas surround the Alaska coastal shore area from Yakutat, Southeast Alaska, to the Arctic coastal waters off Prudhoe Bay.

The sale areas are offshore of predominately isolated wilderness areas containing small enclaves of villages and communities. The access to these communities is limited to air and sea transportation modes.

The Federal Government, following a policy for national energy independence, is scheduling a highly accelerated OCS

development. The expenditure of large amounts of capital by the petroleum corporations coupled with an influx of an overwhelming number of construction, support, exploration, and finally production personnel, will severely impact the communities. The extent of the impact may be traced through the three basic developmental stages: exploration, development, and production.

## Exploration Phase

The exploration phase requires support facilities and services for the seismic and exploratory drilling crews. The support facilities will be located at, or adjacent to, the nearest existing communities. Drilling rigs normally employ 150 men with a complement of air and vessel services, housing, communications, store yards and warehouses.

These minimal service requirements would be taxing to the small coastal communities whose present economy is based upon resource extraction and/or subsistence. A village with a population of 50, 100, or even 500 simply does not have sufficient municipal employees to plan for the impact. A sudden increase in demand for docking, water, land, housing, and utilities can pose severe problems. Water and sewage services are extremely expensive and difficult to provide where permanent exists. Who will bear the burden of the costs associated with the installation of these utilities? There is the problem of knowing how to provide adequate protection against damage from oil spills and disturbance to the

ecology. There is also fear in the villages of what effect development will have upon the fish, the subsistence economy and their way of life.

On the positive side, the demand can also provide economic stimulus in the community for new businesses and a limited number of new non-seasonal jobs.

## Development Phase

The development phase is the most impactful and difficult for the community. Major construction occurs in this phase with heavy manpower requirements. During this phase pipeline landings, storage tanks, tanker terminals, operational facilities are constructed. It may also include liquification plants, refineries, and pipeline systems.

This phase is the most disruptive to the impact areas in social, cultural and economic terms. The experience is expected to be similar to that of the oil pipeline construction, except that considerably smaller communities are involved and most of the inhabitants are Natives. The smallest communities contain the remnants of former Eskimo, Aleut, and Indian cultures. For a limited time period there will be excessive demand for housing, utilities, services, and basic infrastructure facilities beyond the capability of any community to provide.

## Production Phase

Typically what is left after the development phase are highly capital-intensive and low labor

requirement facilities to handle the oil field production. The economy of the community retrenches from boom level activity to a lower level which somewhat exceeds that prior to OCS development.

The final economic impact will hinge on several factors and conditions of the developed petroleum field; the size of oil field and its gas content. Will the field require or support crude oil refineries, gas liquefaction plant, and/or a petrochemical processing industry? Will the oil and gas be piped to other site locations for transporting, delivery or processing?

The answer to these questions will determine the extent of petroleum industry development that can be expected in the community. This in turn will set the economic base and the capability to sustain a services-distribution sector and secondary support industries.

#### **Other Possible Impact**

There is discussion on the possibility for using concrete platforms for Alaska offshore development, rather than the normal steel structures now used. Many believe that cement structures, because of their massive weight would better weather Alaska's extreme environmental conditions. The experience obtained through North Sea development strongly support this contention.

The present technology used for constructing cement platforms differs substantially from the process used for steel platforms.

Steel platforms are built in existing shipyards and then towed hundreds of miles by tug to the drill site. The cement platforms utilized currently have to be constructed locally near the drill site. Cement platforms are apparently difficult and dangerous to tow over long distances.

Cement platforms require extremely deep water for a construction site, large amounts of sand and gravel, and weather sheltered areas. If the decision is made for concrete platforms, this would have a significant impact upon the near shore community or at those site locations that could accommodate their construction. Construction yards on deep water sites would have to be built. Each platform consumes 100,000 tons of sand and gravel and 25,000 tons of cement and requires the labor input of up to 1200 workers for two years. If an offshore or field of a size requiring many platforms is discovered, it takes little imagination to foresee the demand for construction sites and for necessary support services.

In summary, the expectation is that a major portion of the nation's remaining petroleum reserves will be located offshore Alaska. When developed it will place Alaska among the top oil producing states in the nation and possibly in the world. An economic development of this nature will have long range economic consequences. It will set the pattern of growth for most of Alaska's coastal zone.

It will direct the pattern of coastal community development. It will also impose a severe stress upon State and local government to cope with the problems generated by rapid development and to optimize the economic advantages as they occur.

#### **Petrochemical Industry**

The State of Alaska has endorsed a policy of the option for using in-kind future royalty gas

from the Prudhoe Bay field for economic development purposes and for internal consumption. The State is studying the potential demand for royalty gas in three principle areas of use: gas used for heating, gas used for electrical power generation and gas used by industry. The question is, can an adequate demand for Alaska's expected 436 million cubic feet per day (MMCFD) of gas be foreseen, or generated, that will allow for an Alaskan marketable operation.

There is considerable speculation and discussion whether gas can be used for industrial purposes in Alaska. Timing is a factor. If it is assumed that approval for the gas line is given in 1976, construction could begin in 1978. Construction will probably require three years which places the earliest gas producing capability in the year 1981. The time frame of discussion for developing plant facilities for petroleum base products then places the early start at about eight years from now.

An independent study made by one of the country's larger fertilizer companies has concluded there will be a shortage of nitrogen fertilizer in North America by 1984. The study forecasted North American demand, climbing 96 percent by 1984, a shortage of 217,000 tons of nitrogen. The study did find a surplus of North American ammonia capacity could exist until 1981 or 1982, but demand would exceed supply in 1984. The study took into account possible plant cancellation and start-up of new plants. Alaska has experience in the production of petrochemical fertilizer with the Collier Carbon Company's ammonia-urea plant in Kenai. This plant currently produces 1500 tons of ammonia and 1000 tons of urea per day and consumes 60 MMCFD of natural gas.

With the projected increasing world demand for foodstuffs, and the needed increase in farmland production, the late 1980's will require new plant additions for nitrogen fertilizers production, and Alaska with its uncommitted supplies of natural gas will be in a favorable position for new plant location.

The rapid growth in the Alaska construction industry has brought a heavy demand for construction materials. Presently all cement is imported into the State. The magic market figure often quoted for a minimum feasible cement manufacturing operation is one million barrels per year. While statistics of cement importation are lacking, there is little doubt that Alaska's demand is now approaching the annual million barrel consumption rate. New industrial installations would insure and

stabilize that market. An important hydroelectric project, the combination of dams at Devil Canyon and Watana will require tremendous cement supplies. A second industrial project requiring large amounts of cement materials is the Alaska OCS petroleum development. It is estimated that an offshore cement platform will require 25,000 tons of cement during construction.

The possibilities for constructive and productive application of Alaskan energy for Alaskan resource development are enormous. The benefit in raw materials for the national manufacturing base becomes more important when considering the 25 to 30 fold relationship between the G.N.P. and the value of mineral raw materials to sustain it.

The point for consideration is the potential market use for Alaska natural gas in the year 1983 and beyond, not in the light of interest of today.

Given the projected demand for natural gas feedstocks in the nation for the period 1985 to 2010, is it difficult to imagine that a supplier offering on the market an amount of feedstock in the amount of 436 MMCFD will have difficulty finding a buyer? Natural gas is a very scarce resource and one that will continue to remain in scarce supply for the long-term future.

If the trans-Alaska gas pipeline is approved it can have a tremendous influence upon the type and direction of Alaska's future economy. Further descriptive information on potential mineral developments contingent on a significant supply of natural gas in Alaska is presented in the hard rock minerals section of the Basic Industries.

# Alaska Natives & Corporate Business

Following an intense period of land selections in 1974 by the village corporations, 1975 can be characterized as the year of the regional corporation. Reaching an internal balance of organizational expertise and management experience, the regional corporations have exploded into the business mainstream of the State. So far, the twelve regional corporations have been active in housing, petroleum products, air transportation, mineral exploration, hotels, real estate, construction, surveying and banking.

Funding for these ventures stems mainly from the cash settlement under the 1972 Claims Act, which to date totals over \$209 million, received from the Federal Government. Total payments will result in \$962.5 million being received by the regional and

village corporations, with \$500 million coming from the State and \$462.5 million coming from the Federal Government.

By far the single largest stimulus to Native corporate growth has been the pipeline project. Service and construction contracts and purchase orders, valued at nearly \$128 million have been received by the regional corporations and 41 Native-owned firms.

The initial exploration and development of their lands has occupied many of the regional corporations. This type of land use is a monumental step in the unlocking of mineral reserves within vast tracts of previously unexplored territory. A few examples of this activity are Koniag and Nana Corporations signing agreements with Standard Oil of Cali-

fornia, Doyon, Inc. signing an exploratory agreement with Louisiana Land and Exploration Company, and Ahtna signing an exclusive agreement with AMOCO. Thus far the major Native concern in each agreement was that any growth or increase in land use, occur only as a result of well planned exploration and survey techniques.

A total spending pattern of the Native corporations has emerged in the last two years. Construction and real estate investments top the list but substantial funds have been expended in other areas also.

There is no doubt that Native corporations are now, and will be even more so in the near future, a dynamic participant in the economy and business development of the State.

TABLE II  
NATIVE CORPORATION INVESTMENTS BY INDUSTRY <sup>1</sup>

Industry	Value	Proportion of Investment to Date
Construction	\$37,100,000	40%
Real Estate	20,300,000	22%
Banking	15,000,000	16%
Services	14,350,000	15%
Transportation	4,200,000	4%
Wholesale and Retail Trade	1,750,000	2%
Manufacturing	1,200,000	1%
Total	\$93.8 Million

# Basic Industries

## Petroleum & Natural Gas

The last two years saw dramatic changes in the previously lethargic Alaskan oil picture. With national oil crises forcing more attention upon future petroleum resources, the Alaskan oil and gas potential became of paramount importance. The State's estimate of Alaskan oil and gas potential (75 billion barrels of oil and 380 trillion cubic feet of natural gas) revealed that Alaska could have as much as 50 percent of the nation's remaining petroleum resources. These potential resources were responsible for a number of governmental and industrial actions in 1975.

Implementing a major policy decision, the Federal government announced nine lease sales on the Outer Continental Shelf of

Alaska in the next two years. Construction of the trans-Alaska pipeline, which has reached the midway point in construction, also dominated petroleum activity in the State. The possible construction of a trans-Alaska gas pipeline and federal outer continental shelf related petroleum supply and support activities may help take up the economic slack as the oil pipeline winds down.

The Cook Inlet area had its share of interesting, if not so pleasant, events in the last year. Problems began to develop soon after the State's 28th oil and gas lease in December 1973, with law suits holding up drilling on the tracts in Kachemak Bay. No drilling has occurred during the year and the future development of

this area is still in doubt. The State's 29th oil and gas lease sale in 1974 brought in very little bonus money and the final blow fell in 1975 when the courts ruled against the State of Alaska in the Lower Cook Inlet, allowing the area to become federally controlled. A bright spot for the Cook Inlet area was the rise in natural gas prices, increasing the value of its royalty. Gas rose from 22¢ per mcf to 49¢ per mcf by November and may continue to rise if gas continues in critically short supply in the lower 48.

The last but not the least of the major principals in the petroleum activity arena are the Native Corporations who have moved into the oil business in a big way. Contracts between Native Corpo-

CHART IV  
PETROLEUM AND DRY NATURAL GAS  
PRODUCTION AND EMPLOYMENT

Sources: Alaska Dept. of Natural Resources and Alaska Dept. of Labor, 1975 - Division of Economic Enterprise estimates.

rations and oil companies have extended exploration and development to such areas as the Selawik-Hope Basin, Bethel Basin, the North Slope and Kandik Basin. In 1976 drilling will increase in these areas, with possibly the first discoveries in some virgin Alaskan territory.

Despite some problems, the overall outlook for the future is for a sustained, high level of activity in the petroleum industry in the State.

### Production

Daily production averaged 196,000 barrels of oil per day and 181 billion cubic feet of gas per day for the first nine months of 1975. If these average production rates held steady through December, then 1975 oil production continued the slow, steady drop begun in mid-1971 and ended the year with a one percent annual decline compared to 1974. Total State gas production for the first nine months exceeded the twelve month volumes reported for 1974 for both casinghead and dry gas, and is expected to show an increase of about five percent for the year 1975.

### Development

The 46 development well drilling permits issued for the first ten and one-half months of 1975 exceeded the total of 33 permits issued for 12 months in 1974 by 39 percent and many more new applications were expected to be filed before the year ends.

The continuing development in the Cook Inlet Basin kept the State production decline at a minimum. The accelerated development activity occurring in the Prudhoe Bay field cannot boost the State's production until the Alyeska pipeline is put on stream in mid-1977; however, when that time arrives the State production is expected to increase five-fold.

Development drilling in the Prudhoe Bay field proceeded very fast. In the east half of the field, operated by Arco, there were three rigs drilling and one rig being used on workover operations. In the west half of the field, where BP Alaska Inc. is the operator, two rigs were drilling, so a total of five development

drilling rigs were active in this field by year-end. Each rig drills and completes a development well on the average of every 35 days in this field.

### Exploration

A federal Outer Continental Shelf (OCS) leasing schedule announced in November 1974 and revised in June 1975 lists nine major OCS sales for Alaska between 1976 to 1978. These nine sales not only total 37.5 percent of the total federal lease program, but probably represent a significant percentage of the nation's future potential undiscovered petroleum reserves. The sales are North Gulf of Alaska, Gulf of Alaska (Kodiak), Bering Sea (St. George), Beaufort Sea, Outer

Bristol Basin, Norton Basin, and Chukchi Sea. The first 1.8 million acre sale was to be in the Northern Gulf of Alaska in December of 1975. Delay in completion of the final Environmental Impact Statement resulted in a revised sale date of January 1976. Nominations for lease tracts have been requested by the Bureau of Land Management in the lower Cook Inlet and a sale is expected there in 1976 or 1977. The State has also created a certain amount of activity with the announcement of a future (1976) Beaufort Sea lease sale.

Impact studies and actual impacts from the first scheduled

OCS sale in the Gulf of Alaska kept both government and industry active in 1975. In September, industry aborted the first offshore deep stratigraphic test in the Gulf of Alaska. This scheduled 16,000 foot hole was suspended at 5,500 feet after an estimated expenditure of 12 million dollars (\$2,180/foot).

A contract was signed between Louisiana Land and Exploration Company and the Doyon Corporation to drill at least four tests in the Kandik Basin and complete a specified amount of geophysical exploration. Doyon was the most recent Native Corporation holding significant oil potential lands to sign an agreement with industry.

Exploratory drilling in 1975 resulted in 19 wildcat tests; eleven on the North Slope, one in the Selawik Basin and seven in the

Cook Inlet Basin. A gas discovery was reported by Cities Service Oil Company at its Lewis River No. 2 well in the Cook Inlet. On the North Slope, Mobil Oil Corporation's Gwydyr Bay No. 1 discovered commercial hydrocarbons in the Sadlerochit formation and Atlantic Richfield Company's East Bay State No. 1 located petroleum in the Lisburne carbonates.

Geophysical activity has continued at a high level with numerous offshore and onshore crews shooting in the major geologic basins. This activity should continue or increase in the future as a result of Federal and State lease sale schedules.

Exploration and development began in Naval Petroleum Reserve No. 4 with a geophysical contract let for approximately 2,500 miles of seismic data and a development contract to Husky Oil Company for possibly three to five deep tests which will probably be drilled in the winter of 1975-76. It remains uncertain whether the Department of Interior or the Navy will have final jurisdiction over the area.

## Hard Minerals

Mineral production for the past year can be described only in general terms since no preliminary information for 1975 was compiled by year-end. A non-quantitative review of activity may be useful.

For the second consecutive year, sand and gravel production was unusually high, reflecting the demand for such materials for the pipeline pad and other construction. Coal production was estimated at about 750,000 tons, relatively unchanged from 1974.

The platinum dredge, near Goodnews Bay, operated at previous levels. Barite production at Castle Island was temporarily discontinued. The production of gold was expected to almost double in volume, owing to reacti-

vation of the first of the Nome placer dredges and increasing activity by smaller producers. Increase in the total product value will reflect inflation as well as added gold production. No new products were added and volumes generally remain stable.

Exploration expenditures tripled from the \$10 million level of 1974, reaching \$30 million. Joint venture exploration agreements to evaluate Native selection lands, greater drilling activity in the Ambler River-Kobuk Copper Province and in Southeastern Alaska, and also inflated operating costs accounted for much of the increase. Federal mineral exploration also increased sharply in an effort to evaluate the potential of the areas set aside for

proposed special use status under the Alaska Native Land Use Settlement Act. A large lead-zinc-silver and barite bearing zone, near Noatak, was discovered through this activity. At least part of the increase in exploration investment has been influenced by adverse investment climate in other parts of the world and to growing shortages of mineral raw materials for U.S. industry.

Drilling to explore copper deposits in the Kobuk and Ambler River Drainages continued, as did exploration of the copper-nickel deposits in Bchemia Basin and Yakobi Island. Copper prospecting was active in the Wrangell Mountain vicinity. Coal exploration increased slightly owing to concern for energy sources.

TABLE III  
MINERAL INDUSTRY INDICATORS  
(Value in Thousands of Current Dollars)

Production		1971	1972	1973	1974 <sup>1</sup>
Petroleum:	Value	\$257,562	\$235,444	\$261,877	\$438,540
	Volume — 42 gal. barrels	79,494	72,893	72,323	71,540
Natural Gas:	Value	\$ 17,878	\$ 18,463	\$ 19,483	\$ 29,668
	Volume — MMCF	121,618	125,596	131,007	144,021
Sand & Gravel:	Value	\$ 32,806	\$ 15,214	\$ 19,913	\$ 24,936
	Volume — short tons	23,817	14,187	14,999	18,740

## Long Term Prospects

The potential for hard mineral development in Alaska is indicated by surface geologic and known occurrences. The environment for mineral occurrence is excellent, and recognized by industry. Access, underdeveloped infrastructure, land status, and operating climate have limited development in the past. These adverse conditions are changing rapidly, bringing Alaska closer to the day when its vast mineral potential will be mined.

An interesting exercise and possibly optimistic approach assumes that Alaska's per square mile annual product value may equal the average of the eleven western mining states, and can be developed within 20 to 30 years under a realistic operating climate.

### THREE YEAR AVERAGE ANNUAL PER SQUARE MILE PRODUCT VALUE (HARD MINERALS) <sup>1</sup>

Average	11 States	\$3,226
Average	High 4 States	5,697
Average	Low 7 States	1,827
--	Alaska	80

Metals range from 50 percent to 60 percent of product value in the 11 western mining states, but only 25 percent in Alaska. Construction aggregates range from 14 percent to 20 percent of product value in the 11 western states and 60 to 80 percent in Alaska.

<sup>1</sup> Data for 1970 through 1972

## Mineral Development and Availability of Natural Gas

A prime use of natural gas energy in Alaska would apply toward bringing the mineral product value more in line with the indicated potential. A major contribution would be to reduce the transportation cost for metallic products by performing primary reduction to metals prior to shipping.

Copper potential, with sufficient volume to support a smelting operation, has been identified in the Kobuk-Shungnak region, with strong indications of additional similar mineralization along the southern flanks of the Brooks Range, in the Lake Clark-Iliamna vicinity and on the periphery of the Wrangell Mountains.

Base metal potential is indicated in the Mt. McKinley Park vicinity at Mt. Eielson, in the Purkeypile vicinity, in the Kantishna district, and in a belt of sediments south of the Alaska Range.

The nickel-copper mineralization at Brady Glacier and on Yakobi and Western Chichagof Island have been determined to hold excellent potential for important metallic raw materials.

Iron ore potential at Klukwan and at Snettisham, in Southeastern Alaska, and on the Alaska Peninsula, has been extensively studied. Energy requirements are of major importance in the feasibility of pelletized production in each case. A feasibility study completed for Iron Ore Company of Alaska, on the Klukwan iron deposit, list 105 megawatt power requirements among the necessary conditions for feasibility of a plant to mine and produce five million tons of iron ore pellets per year.

The Klukwan iron pelletization plant along with a nickel-copper smelter for ore from the Brady Glacier, Yakobi Island and West Chichagof mines, could make possible a mineral industrial smelter-reduction complex located at Haines. Haines is the terminal of the discontinued military oil pipeline to Fairbanks. The pipeline route and operational support facilities could provide a base for a gas feeder line from the trans-Alaska gas line to a major resource based market. There is also the added possibility of processing ore from current dormant Canadian mines in the Yukon Territory.

These important resource combinations would enhance the volume feasibility for a supplemental gas supply line to the Haines-Klukwan vicinity. Copper-nickel mineralization at Brady Glacier, in Glacier Bay National Monument, and in Bohemia Basin, Yakobi Island, lies dormant after extensive exploration investment by both private industry and government agencies. A plant to reduce the concentrates from these two sources would be feasible after a short water haul from the mine site, to pipeline access to energy at Haines. Economy of scale indicates that an economically feasible concentrating plant at either site would be in the order of 20,000 tons per day of raw ore. Metal content and fuel requirements will depend upon the grade or ore mined. A plant for primary reduction, however, will require a significant amount of fuel. The fuel requirements would increase with increased processing at the plant site.

# Fisheries

Nearly 26 million salmon were harvested in Alaska during 1975. This follows production of only 22 million fish in each of the past two years, but is considerably below the average harvest of 52 million experienced from 1962 to 1972. According to preliminary information, the equivalent of 1.2 million 48 pound cases were canned and 43 million pounds were processed as frozen and cured.

## 1975 Harvest

While Statewide production figures are often used to indicate the condition of the industry, regional variations are often extreme and 1975 was no exception. Especially poor harvests occurred in the Alaska Peninsula, Chignik, Kodiak and southeastern areas. However, good red salmon escapements were recorded in Bristol Bay and above average harvests of pink salmon were achieved in Cook Inlet and Prince William Sound and record numbers of chum salmon were taken in the Arctic-Yukon-Kuskokwim region.

1975 should have been a peak year for red salmon returning to Bristol Bay. Recent history has shown that peak runs occur every five years and the harvest in 1970

was nearly 21 million fish. However, weather related mortalities of young salmon which occurred during 1971 and 1972 are now causing poor returns to the fishery. The total inshore run this year came to 24 million fish. About 4.8 million were harvested and there was an escapement of more than 19 million, which met or exceeded goals for all major systems. Red salmon harvests in 1974 amounted to only 1.4 million fish but most escapement goals were met. With average survival, these two year classes should contribute to good production in 1979 and 1980.

Again this spring ten Japanese motherships and more than 340 catcher vessels entered the high-seas salmon fishery in the North Pacific to fill a catch quota of over

75 million pounds. Some portion of the harvest was composed of fish bound for Bristol Bay and Arctic-Yukon-Kuskokwim area streams this year and in 1976. The Department of Fish and Game has estimated that 900,000 red salmon of Bristol Bay origin would be taken.

A record two million chum salmon were taken in the Arctic-Yukon-Kuskokwim area which includes fisheries in Norton Sound, Yukon and Kuskokwim Rivers and at Kotzebue. However, king salmon catches in the Yukon and Kuskokwim Rivers turned out below average.

In Prince William Sound, the total catch amounted to 5.2 million fish of all species which was substantially above the last five-year average of 3.9 million. A sizable pink salmon harvest brought success in this area. Catches were the largest since 1971 and all escapement requirements were met. While Copper River king salmon harvests were average, poor returns of reds and cohos brought the total catch in this fishery to less than half of average. The total Bering River catch was also less than half of average.

In Cook Inlet, strong pink salmon returns coupled with above average catches of coho and chum salmon, produced the largest harvest since 1970. Pink salmon escapement requirements were met in all lower Cook Inlet streams, but escapements of red salmon to the major Kenai Peninsula river system were below normal.

Southeast Alaska experienced one of the poorest seasons in history. In the southern districts, preseason forecasts called for a total run of only about two million pink salmon in 1975, much less

than escapement required to maintain stock levels. However, 3.1 million pinks were harvested and the escapement amounted to 4.5 million, which with good survival, could produce a strong return in 1977. In northern districts, the predicted return was 4.8 million. The Sitka area contributed an above average 600,000 fish, but less than 30,000 were taken in Icy Straits and other fisheries which normally produce about 80 percent of the catch in this district. Total escapements were estimated at 1.5 million approximately 2.5 million short of escapement requirements. Red, coho and

chum salmon runs in most areas also produced some of the lowest catches on record. The total harvest of all salmon species in the Southeastern area (including Yakutat) was 5.3 million compared to a recent average of 12.8 million.

In a survey recently conducted by the Tlingit-Haida Central Council, the Haines gillnetters dropped from an average \$14,147 in earnings in 1974 to \$4,361 in 1975. The survey sampled about 50 percent of the Native fishermen. In nearby Klukwan, the extent of the yearly decline was more dramatic. Average earnings fell to \$1,485 per fisherman, from \$10,875 a year earlier (1974).

The Kodiak catch remained depressed for the fourth consecutive year. Despite a complete closure of commercial fishing, escapement goals were not met in any of the major red salmon systems. Chum salmon returns were also weak, but the pink catch was the highest since 1971 and most escapement goals were

achieved. The total Kodiak catch amounted to 3.2 million salmon.

The Chignik fishery has been holding up very well, but a small harvest was reported this year. Fishing was not allowed during the early red salmon run, but nearly 400,000 were taken late in the season. Pink and chum harvests and escapements were also very poor. The total catch was 544,000 salmon.

This year, at Unimak Pass and Sand Point, a harvest quota of 233,000 red salmon was placed by the Board of Fish and Game. This action was taken to limit interception of salmon bound for Bristol Bay and other northern streams. Weak runs of local pinks and chums along the South Peninsula resulted in few openings and poor catches. The total South Peninsula catch was 406,000 fish.

## 1976 Forecast

Forecasts provided by the Alaska Department of Fish and Game indicate that Statewide harvests will exceed 30 million fish in 1976, with the most likely harvest set at 34.5 million. Based on this expected harvest and past trends in the industry, production should total about 1.7 million cases of canned and 51 million pounds of frozen salmon products.

In Southeastern Alaska, the predicted harvest of pink salmon ranges from 0 to 4.4 million and it is most likely that only a negligible amount will be taken. Other species are also expected to return at lower than normal levels in 1976 and a total harvest of only 4.2 million fish of all species is forecast.

In other areas, the 1976 season is expected to show some improvement over the past three years:

Area	Species	Estimated Harvest (Thousands)	
		Range	Most Likely
Prince William Sound	pink	4,500- 5,900	5,200
	chum	2,050- 3,650	2,850
Kodiak	pink	7,600-11,500	10,150
Chignik	pink	0- 120	60
	red	0- 520	65
Bristol Bay (Nushagak)	pink	900- 4,700	2,247
Bristol Bay	red	0-13,300	6,500

## Salmon Marketing

Salmon harvests have declined nationwide since 1971. In 1974 the catch totaled about 197 million pounds compared to 213 million in 1973. Alaska is currently producing between 60 and 70 percent of the total. During 1973 more fish than usual were frozen because federal price controls were being imposed on canned products and demand for frozen salmon was high, especially in Japan. In 1974, controls were removed and the Japanese and U.S. economies began to cool. Exports of frozen salmon products which had totaled 61 million pounds (28 million destined for Japan) in 1973, fell to 28 million pounds with only four million pounds going to Japan. Through August this year, frozen exports were again up to nearly 25 million pounds compared to 15 million pounds for the same period in 1974. The largest buyers were France with 6.6 million pounds and Japan with 5.9 million pounds.

U.S. inventories of frozen salmon products totaled about 23 million pounds at the end of September compared with 29 million pounds at the same time last year. Japanese frozen and salted holdings carried over into 1975 totaled just over 20 million pounds which was 60 percent below the amount carried over in 1974.

Last year, 21.5 million pounds of frozen salmon products were produced in Alaska. Preliminary figures indicate that production in 1975 will be much the same. Due primarily to increased sales of air fresh salmon products and freezings of red salmon and chum salmon from the Arctic-Yukon-Kuskokwin area, the proportion of salmon processed by canning slipped from 81 percent in 1971 to 66 percent in 1974.

By June this year, U.S. inventories of canned salmon were reported by the National Canners Association to total 701,000 standard cases. This carry-over just

prior to the new season was significantly greater than the 279,000 cases reported at the same time in 1974 and 220,000 cases in 1973.

The market for salmon products has recently seen consumers demand responding to price reaching a level of definite consumer resistance. Canned salmon prices, which had moved up to record highs in 1973 after the new pack was in, held firm through July 1974 then precipitated a decline in consumption during the first six months of last year to drop to just over 300,000 cases. This was only a quarter of the amount consumed during the same period in 1973. Prices gradually declined and sales increased in the last half (SEE CHART V). Still, consumption was down to 1.2 million cases for the year compared to 1.8 million in 1973. According to the National Marine Fisheries Services, this was the lowest level of annual consumption since records were initiated in the 1920's.

CHART V  
REPRESENTATIVE ALASKA CANNED SALMON WHOLESALE PRICES  
REPORTED BY SEATTLE BROKERS & CANNERS

Source: National Marine Fisheries Service - Fish Market News

U.S. exports of canned salmon products (primarily to the United Kingdom) which totaled 8.3 million pounds in all of 1974 were up this year to over 10 million pounds by the end of August. This compares with seven million pounds exported during the same period in 1974.

Values of canned salmon products continued to fall in 1975. The most extreme losses were seen in red salmon where the price of one-pound cans slipped from \$88 - \$100 per case at the beginning of the year to \$76 - \$80 per case in November. Pink salmon which was selling at between \$68 and \$72 per case in January remained at that level at year-end.

Due to the existing market situation, prices offered to Alaska fishermen were just marginally above 1974 and in some cases price rollbacks were experienced.

In the face of serious price disputes in Bristol Bay this year, one fisherman's marketing association settled for 45 cents per pound for red salmon compared to a price in 1974 of 49 cents.

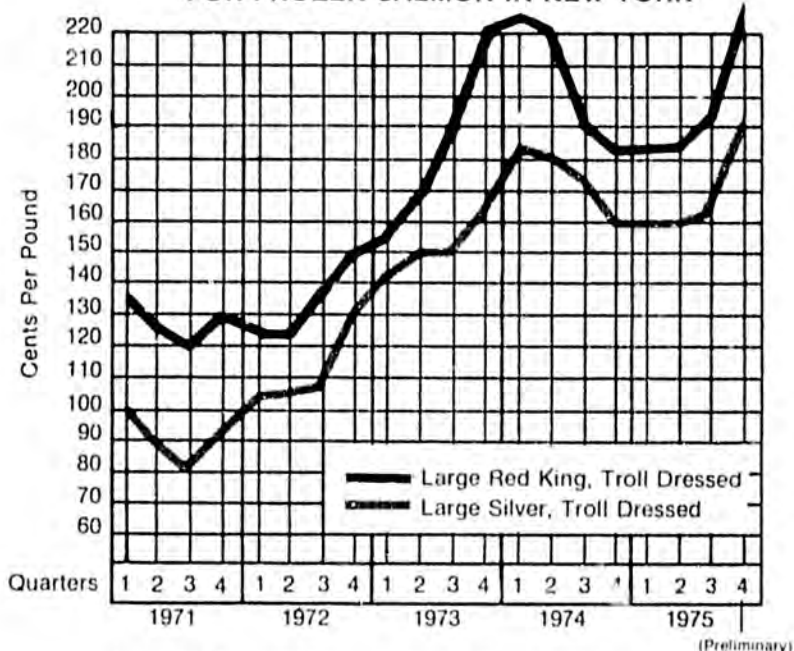

75 king and silver salmon treezings are down substantially over recent years and prices offered to the fishermen were somewhat lower than 1974. However, large red kings which were bringing \$1.85 per pound in New York wholesale markets in January are now being quoted as high as \$2.40. Large troll caught silvers are up from \$1.60 per pound in January to \$2.00.

Statewide production figures issued recently by the Department of Fish and Game show that 1974 salmon production was valued at \$66 million to the fisher-

man. At wholesale, the value was increased to \$137 million. Frozen products accounted for \$21 million and canned products accounted for \$99 million of this total. Because there was a larger harvest this year and prices were somewhat lower, it is likely that the total value of salmon production in 1975 will be about the same.

Salmon from British Columbia reach substantially the same markets as Alaska products and Canadian production was far below normal this year. Since U.S. supplies are to continue to be restricted and market prices are currently lower than quoted for new 1973 production, it is likely that consumption will increase and further price reduction will not occur.

## King Crab

King crab landings in 1974 totaled 95 million pounds compared to 76.8 million in 1973. This year price disputes caused fishing to get underway over a month late. By the end of September only 19 million pounds had been harvested compared to 65 million by the same time in 1974. Specific guideline harvest levels are applied to nearly all king crab fisheries and it is expected that this winter all "quotas" will be met as usual.

Prices to the fishermen at Kodiak in 1973 ranged from 54 cents per pound at the beginning of the season to 85 cents later in the year. In August 1974, when new production began, prices opened at between 35 and 45 cents and were reported at about

35 cents through the season. This year fishermen finally settled for a minimum price of 45 cents at Kodiak and 38 cents in the Aleutian Islands.

The king crab fishery has historically centered in the Kodiak area. Production peaked in 1966 when 159 million pounds were harvested and declined rapidly to 52 million pounds in 1970. The trend has since been reversed by expansion into the Alaska Peninsula, Aleutian Islands and Bering Sea areas. Fishermen and processors with vessels and equipment newly purchased to undertake the western expansion of this fishery were severely pressed by the failure of prices to hold up last year. The situation reflects general economic conditions in the U.S. and Japan and a build-up of unsold inventory due to consumer resistance to high valued seafoods. However, inventories declined significantly from 1974 into 1975, and wholesale prices are increasing. By September 30 of 1975, king crab inventories had been reduced to 3.9 million pounds, which was only about 40 percent of the amount being held a year before.

Wholesale prices of frozen crab meat in Chicago and New York markets reached a high of \$5.65 per pound in 1973 and slipped gradually to \$4.75 - \$4.85 by June 1974. As new production came in, prices continued to fall and at one time, quotes below \$3.00 per pound were given. In July this year prices were up to \$3.45 and by November wholesale prices of \$3.50 - \$3.85 were being reported in Seattle.

In terms of value to the fisherman, the 1974 Alaska king crab catch was worth some \$39 million. The total wholesale value of all production was placed at \$48 million.

## Snow (Tanner) Crab

U.S. inventories of snow crab increased substantially in 1974 as a result of heavier landings and much reduced demand in the important Japanese market. Increased availability of snow crab and high king crab prices probably contributed to the market failure of king crab by bringing some substitution in the market place.

Snow crab harvests in 1974 totaled 64 million pounds compared to 61 million in 1973. By the end of September this year landings had only reached 40 million pounds compared to nearly 64 million in 1974. Production was sharply curtailed early in the year due to poor market conditions. However, the situation appears to be improving and most plants should be operating when the season gets underway in November.

Snow crab harvests were valued at \$13 million to Alaska fishermen in 1974. The wholesale value of all snow crab products produced was reported at \$18 million.

Prices to the fishermen were maintained at about 20 cents per pound during most of 1974, but when new production began in November, prices opened at about ten cents and rose to 14 cents by early 1975. The settlement reached this fall calls for a minimum price of 20 cents.

U.S. inventories of frozen snow crab products totaled a still substantial 5 million pounds on September 30th. But demand is apparently again strong in Japan. Seattle wholesale prices for frozen meat ranged between \$1.90 and \$2.30 per pound last spring and are currently being quoted from \$2.40 to \$2.60.

## Shrimp

Shrimp harvests in 1974 reached 108 million pounds valued at \$11 million to the fishermen, compared to 120 million pounds the year before. Reduced harvests last year were due largely to a strike which tied up vessels in the Kodiak area from the middle of April through July. Catches through September this year amounted to 74 million compared to 70 million pounds for the same period in 1974.

Fishermen received eight cents per pound in Kodiak through 1973 and began fishing under an interim agreement last year for nine cents at Kodiak and 8.5 cents in westward areas. These prices held firm through May when they were reduced to the present level of seven cents per pound.

Frozen Alaska shrimp packed in five pound cans were reported to be wholesaling in Seattle in November at \$1.50 - \$1.60 per pound, compared to \$1.75 at the same time in 1974 and \$2.15 in 1973.

## Halibut

About 25.2 million pounds of halibut were delivered into West Coast ports in 1975. These fish are primarily taken off the Alaska coast by U.S. and Canadian vessels. In 1974, 77 percent of the catch was delivered in Alaska. This harvest compares with 21 million pounds taken in 1974, 30 million in 1973 and 43 million in 1972.

Halibut catches have declined substantially in recent years, apparently due to the incidental take of young fish in groundfish trawling operations conducted by Japan and the Soviet Union. Negotiations by the International Pacific Halibut Commission have helped to reduce foreign harvests in some critical nursery areas and slight improvements in U.S. and Canadian catches per unit of effort are being observed.

Ex-vessel prices at Kodiak were reported at 74-78 cents per pound this spring, compared to 55-66 cents in June last year and about 60 cents in 1973. Statewide landings in 1974 were valued at about \$11 million to the fishermen.

## Bottomfish

As yet trawlable species such as ocean perch, cod, pollock, flounder, and so on are not produced by Alaska fishermen in significant volumes. Production seems to be stalled primarily by unsatisfactory market conditions. But impetus to this industry should be supplied by creation of an exclusive 200 mile fisheries zone and subsequent reduction in the activity of foreign vessels off the Alaska coast.

The 1975 session of the United Nations Law of the Sea Convention in Geneva concluded this spring without producing a treaty. According to observers there is general agreement among participating nations on the concept of a 12 mile territorial sea and on a 200 mile fisheries zone. Another conference is scheduled to be held in New York next year. However, many people feel that Congress will take unilateral action to declare a 200 mile fisheries zone in the near future before an international treaty is adopted. The exact form such extended fisheries jurisdiction might take is not yet clear.

## THE FUTURE OF ALASKA SALMON FISHERIES

Alaska salmon runs have declined to critically low levels. Statewide harvests this century reached a peak in 1936 when 126 million fish were taken and steadily diminished until 1959 when production reached a level of 25 million. During the 1960's, average harvests improved to just over 50 million fish per year, but the past four years have seen production levels drop from 32 million in 1972, to 22 million in 1973 and 1974, and 26 million this year.

Year to year fluctuations in salmon abundance are natural and expected occurrences caused by factors such as water conditions and temperature, abundance of predators, availability of food and so on. Poor production levels achieved during the past four years are blamed specifically on abnormally high mortalities of juvenile salmon spawned or reared during severe winters of 1970-71 and 1971-72. This short-term problem only serves to compound the impact of a basic long-term decline which has been occurring for the past thirty years.

The key to reversing this trend is not simple. Harvests have been severely restricted during recent years. But, in spite of total and near total closures in many commercial fishing areas, the number of salmon returning to spawn in some streams have been below optimum levels. It is only necessary to reflect on the sheer size of the State and the great number of salmon streams that are involved in order to have an understanding of the problem facing scientific management. The optimum carrying capacity of each stream and maximum commercial utilization can only be achieved by careful manipulation of the number of fish allowed to pass through the various commercial fisheries and spawn.

Salmon management is a complex and demanding job that sometimes becomes an emotional issue when few fish are available and so many people are dependent on the resource. However, new data and techniques are constantly being developed to improve natural productivity. The inherent potential of Alaska's salmon runs still exists and the environment, the watersheds, streams and ocean, is still basically the same as it was a hundred years ago and just as able to produce salmon. The status of Alaska's commercial salmon fisheries during the last half of the 1970's will depend on the rate of recovery from current depressed levels. If climatic conditions improve and survival rates are

similar to those of the 1960's, salmon harvests should improve to 40-50 million fish by the beginning of the 1980's. However, if recent cold weather patterns still persist, these fisheries could remain depressed. It has been estimated that Alaska's waters are capable of harvestable surpluses of some 100 million salmon per year given favorable weather conditions, a healthy environment and sound management. However, natural production will always be subject to the vagaries of weather and environmental change which causes cycles and fluctuations to occur.

In 1974, Alaska established a renewable resource fund which will receive "not less than five percent of the receipts paid the State from mineral (includes oil and gas) lease bonuses and rentals for State land and royalties derived from minerals on State land." These funds are to be spent for "funding for capital and operating expenditures for the rehabilitation, enhancement and development of renewable resources programs." This is the first step toward correcting any detrimental effects which may occur to fisheries from future oil, gas or mineral development and is a positive effort to expand and improve the renewable resource base of the State. Based on expected income from just oil and gas development currently in process, this fund will begin to receive at least \$50 million per year beginning in mid-1977. Salmon rehabilitation programs could receive a portion of these funds when they become available.

In addition to basic regulatory management, Alaska is in a position to benefit from advances made during the past two

decades in methods for supplementing and improving natural salmon production. In some cases existing salmon runs can be improved by increasing survival at one or more stages by modification of existing spawning or rearing areas. In other cases where spawning grounds or rearing areas essential to salmon fry production are limited or non-existent, artificial spawning channels, incubation facilities, salt-water rearing pens and other such systems may be developed.

Recent breakthroughs in pink and chum salmon larvae research have led to development of hatchery incubators which use gravel or other rugose substrate. Such systems produce fry of higher quality than conventional methods and at significantly less cost. Pilot gravel incubator hatcheries have been established in Oregon, Washington, British Columbia and Alaska, and are proving capable of supplementing natural production.

Alaska has an excellent opportunity to apply these supplemental salmon production programs. Production of sockeye, king and coho salmon can be increased because there are numerous underutilized freshwater rearing areas. Thousands of acres of spawning area are available if fish passage facilities can be constructed. Numerous estuaries and lagoons are available where rearing could take place.

With the establishment of a Division of Fisheries Rehabilitation, Enhancement and Development in 1971, Alaska initiated a formal salmon aquaculture program. At present there are about a dozen salmon production facilities in various stages of development in the State with construc-

tion of 10 more being planned as a result of passage of a major bond issue last year.

An important feature of hatcheries is that environmental factors are closely controlled during the critical freshwater rearing period and mortalities due, for instance, to cold weather are less likely to occur.

Fry released from a hatchery will mingle with wild stocks and as adults be harvested as a part of the common property fishery. Since wild stocks will never support exploitation levels of more than 75 percent (usually much less) and hatchery stocks, because smaller numbers of brood fish are required, can sustain harvests of as much as 95 percent, substantial numbers of surplus fish will return to the hatchery. Ideally, these surplus fish should be sold to underwrite the cost of operating the hatcheries and one approach is to create a legal basis for private hatcheries. In 1974, the Alaska State Legislature recognized that hatcheries could be self-supporting and encouraged such development by passing an act to permit the operation of private salmon hatcheries by nonprofit corporations. Last year the Legislature went a step further to modify the State Commercial Fisherman's Loan program to allow loans for private hatchery development.

Three permits have already been issued to construct private hatcheries and applications are being made by a number of different organizations. Should "proprietary" fisheries created by private hatcheries prove to be financially successful, a salmon farming industry may emerge over the next several years. Such

a proprietary fishery conceivably could attain economic importance in its own right, while at the same time contributing substantial numbers of salmon to the common property fishery. Even if fish, returning to a private hatchery do not have sufficient value to cover costs, there is a possibility that fishermen would tax their catches to cover the deficit, provided they are convinced that the added value of hatchery fish in their catch makes the added subsidy worthwhile. There are circumstances where the operation of hatcheries by fishermen's associations will become practicable, especially where limited entry to the fishery gives the participating fishermen a proprietary interest in any hatchery fish returning to a particular fishing ground.

# Forest Products

The harvest of timber in Alaska dropped a substantial 29 percent in 1975, from last year's total of 623 million board feet to an estimated 445 million board feet. This was the second year of decline from the 1973 record high harvest of 679 million board feet (MMBF) and again reflected recession conditions in the Japanese and United States economies.

The major source of timber in Alaska, the U.S. Forest Service, estimated the volume of timber harvested on national forest lands to have fallen 145 MMBF to 410 MMBF, a decrease of 26 percent. Similarly, the harvest of State timber dropped 20 percent to a total of 43 MMBF. The Bureau of Indian Affairs reported an enormous reduction last year; from nearly 12.1 million board feet in 1974, the cut plunged more than

12 million board feet to a total of 52 thousand board feet in 1975. In contrast to the general trend, cutting along the pipeline right-of-way plus increased local construction promoted an eleven-fold increase in the harvest on lands administered by the Bureau of Land Management. From a relatively low level of 114 thousand board feet, the harvest rose to 1.2 million board feet.

The principal cause for the continued drop in the harvest was the depressed market in Japan for cants, pulp, and other forest products and the recent recession affecting the world market. This forced the complete or partial shutdown of many mills. During 1975 Ketchikan Pulp had three shutdowns ranging in length from three to six weeks and expected a reduction in output

of approximately 30 percent. These shutdowns were the result of inventory adjustments.

Ketchikan Spruce Mill alternated between one and two shifts through the year and scheduled one shift for the last quarter of the year. Alaska Timber Corporation, Klawock, was shut down most of the year. Alaska Wood Products in Wrangell operated with double shifts during the year with two temporary closures for maintenance purposes, totaling one month. Production at Wrangell Lumber Company was achieved with only one shift and the firm was involved in a labor dispute during November. Alaska Lumber and Pulp Company, at Sitka, had three shut downs totaling approximately seven to eight weeks. These shut downs were also the result of inventory control.

In October Alaska Lumber and Pulp Company idled most of its woods crews and the Ketchikan Pulp Company closed down its Thorne Bay Logging camp. At the time both firms had log inventories of sufficient size to maintain production until spring. Therefore most logging operations will remain closed until at least March and possibly April, depending upon demand.

During the first three quarters of 1975 the value of timber exports declined five percent. In terms of volume even more substantial decreases were registered by all categories of exported forest products. Round log exports dropped in volume by 13 percent to 23 million board feet while the value increased 18 percent to \$7.3 million. Sawn products, mostly cants plus a small amount of dimension lumber, fell eight percent to over 257 million board

CHART VIII  
FOREST INDUSTRY INDICATORS

\*Preliminary

Source: U.S. Forest Service, Alaska Division of Lands, U.S. Bureau of Indian Affairs, U.S. Bureau of Land Management and U.S. Department of Commerce

feet. The value declined seven percent to \$57 million.

Pulp exports dropped in both volume and value. A sharp decline of 18 percent reduced pulp exports to 118,300 tons in the first nine months of the year. The total value of exported pulp declined a more moderate six percent to \$45 million, reflecting higher unit prices. The export price of pulp was relatively stable at about \$385 per ton, compared to \$334 per ton for the same period of 1974. It might be noted that the unit price continued upward to \$400 a ton the last quarter of 1974 and was subsequently forced downward by slackening demand and rising inventories.

Since most of the forest products industry is heavily dependent upon Japanese demand, the outlook for this industry is tied closely to that of the Japanese economy. According to statistics in the *Japan Lumber Journal*, the number of wood based dwelling starts showed signs of recovery during the first half of the year and attained a record high in July. New starts of wood dwellings reached a low in January

1975, of 3,848, then followed a steady upward trend to reach 9,067 in July. The July figure was four percent over the July 1974 total and three percent above the previous high in 1973. A continuation of this trend should have a positive effect upon Alaska exports of wood products and therefore reduce inventories. However, it should be noted that Japan has other sources of supply within the Pacific Rim and there may not be a dramatic advance in Alaskan exports.

An important increase in timber harvest is anticipated in the Southcentral region of Alaska during 1976. Kodiak Lumber Mills at Tyonek started operations in the last half of the year and should be exporting to Japan during

1976. Estimates of harvest from this sale call for approximately 75 thousand board feet during 1976 and 100 thousand board feet in 1977. The sale will total about 300 thousand board feet of beetle-killed spruce.

# Construction

For the second consecutive year, construction was the dynamo which propelled the economy to dizzy heights of activity. Last year's record employment level was nearly doubled in 1975 and the value of building permits issued soared. As was the case in 1974, the trans-Alaska oil pipeline project and other construction related directly or indirectly to the petroleum "boom" were responsible for the unusually rapid expansion.

Employment in construction attained an unprecedented monthly average of approximately 27,900 during the year, almost double the year-earlier average of 14,066. Over half of the construction workers were employed on petroleum-related projects. At the peak of construction activity, employment was estimated to be around 40,000, including about 25,000 working on the Alyeska

pipeline project and on development of production and support facilities at Prudhoe Bay. Of this 25,000; 20,000 are on the line, and 5,000 on the production and support facilities. A portion of the remaining workers were engaged in constructing new or expanded administrative offices, warehouses, and other structures for the petroleum and petroleum support companies, primarily in Anchorage and Fairbanks.

Preliminary data for the first three quarters of 1975 indicates that the value of building permits increased at a rate parallel to that of employment. During this period three of the five largest local governments reported permits totaling \$176 million, more than double the total for the same time span in 1974. The vigorous activity in commercial construction was reflected in commercial building permits, which rose

roughly 140 percent. The value of residential building permits rose at a relatively more moderate, but still impressive, rate of over 60 percent.

The only negative sign in what was an otherwise phenomenal growth year for the construction industry was a decline in the value of contracts awarded by the Alaska Department of Highways. During the first ten months of 1975 highway construction contracts awarded amounted to \$92 million, or nearly ten percent below the cumulative total for the same period of the prior year. In 1974, the Yukon River bridge contract was so large, it dwarfed all other contracts and effectively removed the validity of year to year comparisons. Excluding that one contract, construction contracts were higher in 1975.

The prospects for highway construction are quite good.

CHART IX  
CONSTRUCTION INDICATORS

Source: Alaska Department of Labor.

A significant amount of federal funding is anticipated to repair highways damaged by the heavy truck traffic relating to the pipeline project. In November a U.S. Senate subcommittee approved a bill appropriating \$70 million for such repairs.

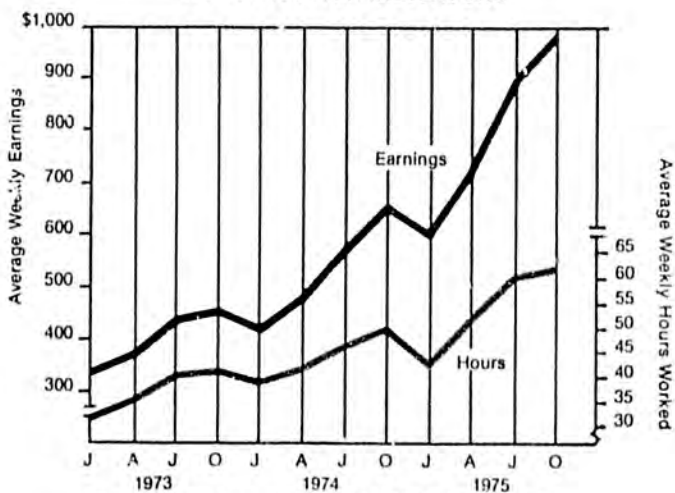

Over one-third of the huge pipeline project was completed by year-end; more than half of the line was laid and roughly one-fifth

of the pump stations and Valdez terminal were finished. One key sub-project, the construction of the first permanent bridge across the Yukon River, was completed in October. Seasonal reductions in force were noted during the last quarter. Project employment is expected to reach a summer high of 18,000; next fall, layoffs will be earlier and heavier if the pipeline is completed by September,

as scheduled. Work will continue on the terminal and pumping stations through mid-1977.

Major projects slated for construction during 1976 include a \$35 million power generating plant and a \$30 million petroleum refinery. These plants will be adjacent and located at North Pole. The refinery will provide fuel to the power plant which will in turn supply electrical energy and heat to the refinery.

# Tourism

Approximately 265,000 tourists visited Alaska in 1975, raising the economic impact to more than \$88 million, or ten percent over the 1974 totals. Continued airline growth accounted for the bulk of the increase, with slight increases noted for the Alaska Marine Highway System, cruiseships, and highway traffic.

The adverse publicity given spiraling inflation and crowded conditions associated with pipeline construction has been regarded by several of the major tour wholesalers as the major factor in keeping the growth rate considerably below the 15 percent annual average growth rate experienced during the late

1960's and early 1970's. Although the national general economic climate has started to improve, high unemployment and reduced disposable income in many of Alaska's major market areas has retarded the potential growth of Alaska tourism.

Most hotels, gift shops, car rentals and other tourism related services have experienced dramatic growth due more to business traffic, than to tourism traffic increases. Tourism in past years has accounted for approximately 40 percent of total traffic into Alaska and is now felt to be between 25 percent and 30 percent of the total. As an indication, air traffic into Fairbanks was up over 75 percent during the first half of 1975 and air traffic through-

out Alaska increased approximately 40 percent.

Some regional fluctuations have occurred. Hotels in Southeast Alaska have not shared in the general increase in tourism. Cruiseship traffic has doubled since 1970 which has drawn otherwise hotel destined pleasure travelers.

If the national economic climate continues to improve and unemployment is reduced, tourism should grow by a greater percentage during 1976. With an increase in tourism related facilities available next year, and a decrease in the adverse publicity related to pipeline activity, tourism traffic should again exceed the ten percent rate of the last two years.

CHART XII  
NUMBER OF TOURISTS ENTERING ALASKA

# Agriculture

Although even preliminary statistics on the performance of the agriculture sector in 1975 will not be available until spring, from all appearances there was little change from 1974. The attrition of farms and production in the Matanuska Valley continued, albeit more slowly, but slight gains in other areas nearly offset these losses. Probably the most significant change occurred in

the Delta Junction area, with more farmers moving from grain to hay or straw as a primary crop.

On the positive side, one component of Alaska's food production, greenhouses, showed significant gains. Although these gains were not tabulated and will not be reflected in the gross value of products for agriculture, greenhouse production expanded and

diversified. With profitability proven, this expansion should continue. The prospect of large amounts of waste heat from pipeline related sources and unmet local demand for fresh product augurs well for expanded operations. In the next five years, there is little doubt that greenhouse production will be the fastest growing segment of agriculture.

Agriculture has the potential to become a major sector of Alaska's economy. This State is unique among the 50 states, and in fact in the world, by having huge, contiguous tracts of potential cropland still on the control of the government. Further, Alaska does not have a large population requiring development of these lands to feed Alaskans. While there is assuredly an Alaskan market for increased production, there exists an opportunity to develop these areas as planned units with production geared to the world market. Large landholders including the federal, State, and local governments and Native Regional Corporations could form common agricultural areas in the Nenana, Kantlisha, Big Susitna Valley and Yukon Flats which could become models of agricultural efficiency.

There are reasons why pressure to develop these agricultural croplands has not yet surfaced including economic constraints, restriction of access, and problems arising from the Native Land Claims Act, and subsequent federal withdrawals. Who will ulti-

mately control specific parcels is not yet known. Hindrances will not be overcome until the international gap between demand and supply for food broadens, bringing real food prices up. No one can predict with accuracy when this will occur, though agricultural experts are nearly unanimous that it will happen. Until that point, it appears to be in the best interests of the controlling landowners to begin to formulate policies and programs that will direct such development when it does occur and to ensure that those lands will be available when economic and land scarcity will make them a valuable agricultural resource.

The dangers of lack of planning and positive policy are apparent when one considers the possible detrimental effects which would occur if uncoordinated private settlement occurred in the presently unused areas, without prior research and planning.

In addition to surveys and research, other steps could and should be taken to develop agriculture. One of the biggest deterrents to expansion today is the

lack of investment capital. Only the State, through its loan fund, has shown an inclination to finance new enterprises and expansion, and it is chronically short of funds. Other financial institutions feel agriculture has a limited potential and profitability, a view which ignores the long-term probabilities.

Another problem of the industry is a lack of a marketing system. In Alaska the burden of marketing products falls on the farmer. The agricultural middle man or wholesaler has not developed to the proper degree. Alaskan farmers regularly market to retailers, and in many instances straight to the consumer. Unfortunately, it is not yet possible for the middle man to receive sufficient profit due to low production.

The entry of a Native regional corporation into the reindeer industry is of considerable importance for the future. If this trend is followed by other corporations a turnaround in reindeer production may take place as the financial and managerial abilities of the corporations are put behind efforts to create a commercially viable industry.

# Support Industries

## Transportation - Communications - Public Utilities

All key measures of economic activity in the transportation-communication-utilities division registered appreciable gains in 1975, boosted by continued strength in those transportation sectors experiencing the greatest demand from the Alyeska pipeline project. Employment at 15,200 was 23 percent above the prior year average. Trucking and warehousing was the prime mover in this expansion. The addition of an average of 1,100 jobs boosted employment in that industry by over 50 percent to an estimated 3,300. The first full year of work on the pipeline and the completion of the pipeline access road saw a high level of pipe hauling from storage yards to Valdez, Fairbanks, and Prudhoe Bay, as well as hauling of other construction equipment and camp supplies. Air transportation also participated in the uptrend, with employment advancing at a rate of over 20 percent. In comparison to the transportation industries, employment gains within communications and utilities were more moderate.

The volumes of air freight and passenger traffic through the two busiest airports, at Anchorage

and Fairbanks, posted record highs in 1975. Overall, air freight jumped over 50 percent, according to partial year data, reaching between 390,000 and 400,000 tons in 1975. Air freight from Fairbanks paced the total advance by rising about 65 percent; only during the final quarter were there indications of a slackening in air freight, due to a seasonal slowdown in pipeline construction and the completion of the Yukon River bridge on the pipeline access road. Anchorage International Airport reported a relatively smaller increase of 38 percent in air freight and the annual volume for Anchorage is expected to be less than half that of Fairbanks. Passenger traffic also continued upward in 1975 at these airports; the combined traffic was nearly 40 percent above 1974, with the Fairbanks airport again leading the way with a rise of 75 percent during the first half of the year. Heavy utilization was made of the Fairbanks airport for transporting construction workers to and from camps situated north along the pipeline route; the impact of this factor was compounded by the "R and R" of pipeline workers and by high turnover on the project.

Data on shipments passing through the Port of Anchorage also reflect the continued influence of high construction activity; for the past nine months of 1975 nearly 2 million tons of goods, including almost 1.3 million tons of petroleum and related products, were handled at the port. The total volume was up 25 percent while petroleum products rose at a slightly slower rate of 19 percent. Although jet fuels were an important component of incoming petroleum products, the demand for other fuels expanded more rapidly.

The Alaska Railroad hauled up to 45 percent more tons of freight than in 1974, according to the limited data available. At least one-third of its freight during the past year was related to the petroleum industry.

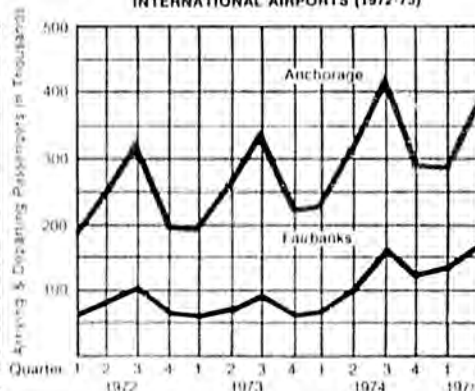

Waterborne shipping services were expanded substantially during the year. The existing barge transportation companies added to the number of Washington-Alaska sailings per week. Totem Ocean Trailer Express established a new containerized freight service between the "lower 48" and Anchorage with its huge freighter, the Great Land.

# Finance & Real Estate

The banking sector demonstrated a strong uptrend in the first nine months of 1975. Total assets increased 26 percent to \$1,626 million, compared to a rise from the total year of 1974 of 25 percent. Total deposits increased 29 percent to \$1,417 million. This compares favorably to the 24 percent growth rate experienced during the entire year of 1974. Most of the increase in total deposits occurred in demand deposits (+38 percent) while time and savings deposits increased 22 percent.

The first nine months of 1975 saw a growth in the financial community through the chartering of the first two commercial banks chartered since statehood (United Bank Alaska and Alaska Pacific Bank, both in Anchorage), and the opening of five branches of state-chartered financial institutions. Growth was also experienced in the national bank sector through the increase in the number of branches and the opening of the new Security Pacific National Bank in Anchorage.

Although many business establishments within the communities impacted by the pipeline experienced considerable difficulty in retaining employees, financial institutions in 1974 may have had

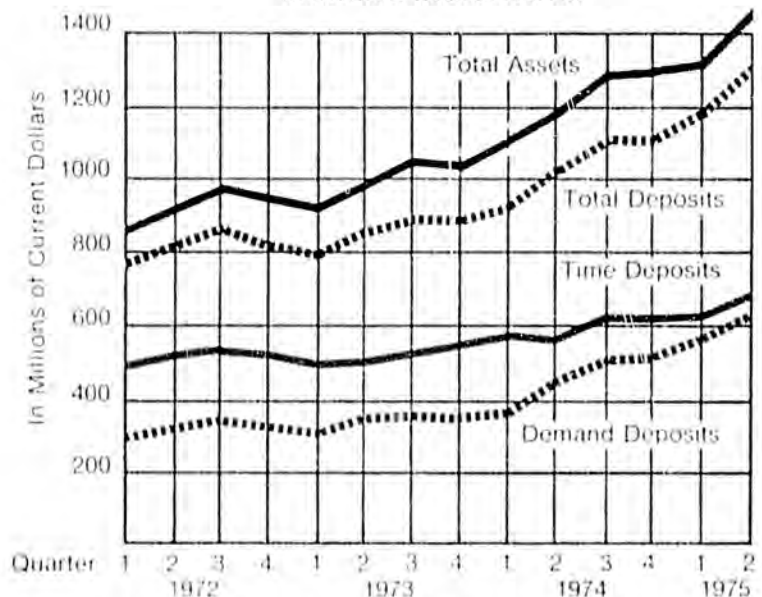

an even higher rate of turnover than businesses and other industries. However, in 1975, this trend was reversed with banking personnel increasing in numbers and becoming relatively stable in terms of job turnover. Previous pipeline losses led the financial community to increase the numbers and the depth of management personnel, such action working as a benefit to the entire financial community.

High interest rates have imposed a severe burden in the long-term borrowing market, particularly as it relates to housing and long-term business capital financing through the elimination or restriction of various secondary mortgage markets. Enactment of a Federal law providing for interest rates five percentage points above those charged by the 12th Federal Reserve District, versus the State's

four percentage points above the 12th District's interest rate, has eased the business loan market but has done relatively little to ease the construction lending market, and has had no impact on the home mortgage market.

The securities industry in Alaska, the activity of which is dictated by that of Wall Street, has seen a shift in emphasis of investment type to the tax-sheltered limited partnership form of business venture, especially in oil and gas and real estate programs, and an increase in the number of mutual fund type offerings. The number of applicants seeking registration under Alaska's Securities Law has also declined, again, due to the relative inactivity of Wall Street since businesses have delayed expansion programs or are financing such plans with past and present income rather than equity or debt securities offerings.

CHART XVI  
BANKING INDICATORS

Sources: Alaska Department of Commerce & Economic Development

The number of enforcement actions against security and out-of-state land sales frauds was significantly higher during the first nine months. However, the change reflected more vigorous prosecution on the part of the State rather than an actual increase in the number of frauds perpetrated upon Alaskans.

Promoters of "outside" subdivided land for recreation and investment continued to register for sale in this state about the same number of subdivisions as in 1974. The number of new corporation filings through October, 1975, on an annualized basis, did not exceed that of 1974. However, 1974 was exceptional because of several hundred filings by corporations created pursuant to the Alaska Native Claims Settlement Act.

### Real Estate

A lack of rental housing and low-to-medium priced homes for sales continued through 1975 in the rapidly growing communities of the State, as the labor force and

population continued to swell. In sharp contrast to the trend of residential construction at the national level, new housing starts in Alaska were up 15 percent during the first five months of 1975. As noted in the construction section of this report, the value of residential building permits issued by a sample of local governments was 60 percent greater during the first nine months of 1975 than a year earlier.

Postal vacancy studies undertaken in May 1975, revealed vacancy rates of one percent for Anchorage and 0.6 percent for Fairbanks. The situation in Valdez has been extremely "tight" where the relative impact has been considerably greater.

A further vacancy study done in October 1975, revealed that of some 46,326 rental units in Anchorage, the vacancy factor had increased to 2.3 percent. However, there had not been much relief in the needed area of the low and moderate income units.

A controversial Rent Review Program, following legislative

mandate, was established by the Department of Commerce and Economic Development in Anchorage, Fairbanks and Valdez in July 1975. This program was a departure from traditional rent stabilization/control programs attempted in other parts of the country. Its basic purpose was to prevent excessive gouging that followed a considerable imbalance between supply and demand of rental housing. The program was opposed by elements of the landlords and tenants, for opposite reasons. Nevertheless, the program did, with limitations, appear to meet its basic goal.

The landlords felt that the program was an infringement upon the free market principle. The tenants special interest groups felt it did not go far enough. The program was able to avoid a very dangerous pitfall, of other rent control programs, the inhibition or the lack of incentive to build new rental housing. This has not been the case in the Alaskan program.

## Trade & Service

Except for export trade, the trade and service sectors enjoyed continued expansion during the past year. Total employment in each sector was at least one-fifth above the 1974 levels and a number of component industries registered even greater relative gains. Although the trans-Alaska pipeline construction was the single factor which can be pointed to as having the largest economic impact, a significant portion of the growth of these and other distributive industries came in response to other developments in minerals and to expanded governmental expenditures.

Trade employment rose approximately 20 percent annually to about 25,500 from 21,135 in 1974. Wholesale trade rose faster than retail trade, with advances of 31 percent and 18 percent, respectively. As noted in the section pertaining to the Anchorage economy (where roughly 70 percent of all wholesale trade jobs are located) the wholesale trade

industry attained an important stage of development in 1975. In this period many firms expanded (in terms of capacity and products) mechanized, and/or otherwise improved the efficiencies of their operations. The size of the industry is considered to have reached a "critical mass" level of self-sustaining growth. This is not to gainsay, of course, the importance of the interdependency of this industry relative to other sectors of the economy or even the significance of exogenous forces such as federal military expenditures.

Retail trade employment was hiked from 17,085 to about 20,200 by marked gains in the eating-drinking, automotive-service station, and general merchandise-apparel industries. Around 1,000 additional jobs were created in eating and drinking establishments, increasing industry employment by nearly 20 percent to 4,900. Employment in the automotive and service station indus-

try increased 24 percent to 3,200 while the general merchandise and apparel work force rose from 4,126 to an estimated 4,650 (+13 percent). Higher levels of employment were also noted in other retail trade industries.

A growth rate of approximately 23 percent was experienced by the service sector, with employment averaging 22,500 for the year. Significant advances took place in business (+1,700) "all other" (+1,200), medical (+700), and lodging (+600) services. The unusually large increase in business services, representing a 59 percent jump from the 1974 level, was centered in miscellaneous business services which includes research, development, and testing laboratories; management and consulting services; security services; and equipment rental and leasing services. Growth occurred in those firms supporting mineral development and the related general business expansion.

Gross business receipts for trade rose 46 percent in 1974, the most recent year for which data is available, and the final 1975 statistics should reveal a continuation of the uptrend. If the realized growth rate is again 46 percent, total wholesale and retail gross receipts will have increased from nearly \$2 billion in 1974 to over \$2.9 billion. Wholesale trade receipts were up 44 percent to \$607 million in 1974; if the other economic measures of activity in wholesale trade are accurate indicators, gross receipts in the sector may have reached or exceeded \$900 million in 1975. On the other hand, gross receipts for retail trade establishments may have grown at slightly less than the 1974 rate and are expected to

total \$2 billion. In real terms, eliminating the high inflation of the period, the growth rate was considerably less.

The overall value of exported Alaskan products rose significantly in the first nine months of the year, as compared to the same period of 1974, and exceeded \$200 million. Not included in the latter figure would be a sizable amount for Alaskan seafoods exported from Seattle. The values of natural gas and its fertilizer derivatives rose substantially, reflecting the Pacific Rim market in which demand was high despite unit price increases. The value of exported urea nearly quadrupled and natural gas exports increased 84 percent in value. Ammonia exports were

up a more moderate 18 percent. In contrast, lumber products and pulp declined five to six percent despite higher prices per unit. (For further detail, please refer to section on forest products.)

Divergent trends were recorded in the volumes of key exports. The volume of each major export product, except natural gas, moved in the same direction as overall value: appreciable gains of 18 percent and 12 percent were recorded for urea and ammonia fertilizers, while pulp exports decreased 18 percent and lumber products, including logs and cants, fell nine percent. Natural gas exports dropped eight percent.

TABLE VII

Ammonia (short tons)	74,001	82,973	+12.1%

# Government

Historically government, local, State and federal, has been the mainstay of the Alaskan economy, providing more jobs and income than any other major sector. In recent years, however, the relative importance of government has declined, reflecting the more rapid growth of private industry. This healthy trend continued during 1975. Although government remained the largest employer, with over 46,000 workers, its share of non-agricultural wage and salaried employment fell from 34 percent in 1974 to about 29 percent in 1975. Further, partial year data indicates that the construction industry surpassed government in terms of wages and salaries paid, for the first time.

A growth of around six percent in total government employment was paced by a sizable upswing in local government. Small increments took place at the Federal and State level. Employment in local government was up approximately 14 percent in 1975. The major increase in this sector was due partially to the transfer of State operated schools in the unorganized borough to local governmental units, and partially to the greatly increased demand for services within the pipeline-impacted communities.

Until 1974 Federal Government employment was static at a monthly average of 17,200. In 1974 Federal civilian employment posted a moderate gain of five percent and this trend continued, albeit more slowly, in 1975. Much of the increases stemmed from

the petroleum development, including the monitoring of pipeline construction and planning for OCS development. The active duty military component also increased fractionally in FY 1975, reversing a gradual downtrend registered during the preceding six years. Additional Army personnel were stationed in Alaska. The disestablishment of the joint Alaskan Command (ALCOM) was offset in terms of manpower when its functions were absorbed by the separate services.

State government demonstrated modest employment growth. The need to exercise fiscal restraint led to limitations on new positions and the transfer of 800 employees from the State operated schools system slowed the previous rate of increase.

CHART XVII  
GOVERNMENT EMPLOYMENT  
(1970-1975)

Sources: Alaska Department of Labor & Headquarters Alaskan Command.

CHART XVIII  
FEDERAL GOVERNMENT EXPENDITURES  
(FISCAL YEAR 1970-1975)

Sources: Federal Information Exchange System & Headquarters Alaskan Command.

While employment within the Federal sector, civilian and military, were relatively static or declining the past five years, expenditures expanded quite rapidly. Civilian programs increased from \$447 million in FY 70 to approximately \$710 million in FY 75.

Military outlays increased from \$346 million in FY 70 to \$447 million in FY 74, or 29 percent. The major increases in expenditures were military pay, up 59 percent to \$223 million and the civilian payroll, rising 29 percent to \$80 million. Operations, maintenance and construction outlays were only slightly higher during the period. Estimates for FY 75 indicate a seven percent increase to \$478 million for military outlays with payrolls accounting for the bulk of the change, as in the past.

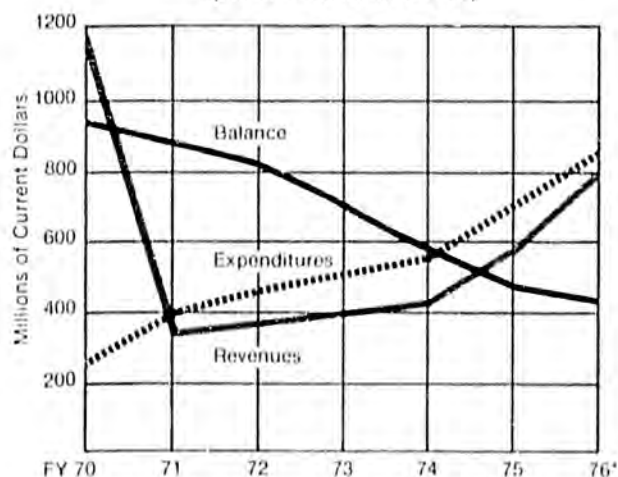

General fund revenues and expenditures within the cities and boroughs of Anchorage, Fairbanks, Juneau, and Ketchikan demonstrated strong growth in the past five years. Total revenues

jumped from \$84 million in FY 70 to \$189 million in FY 74 for an increase of 124 percent. During this period intergovernmental revenues more than doubled. Property taxes were 84 percent higher and sales tax receipts were up 46 percent. Revenues rose 17 percent to \$221 million in FY 75 with both property taxes and intergovernmental revenues. Local government expenditures increased proportionately to revenues during the past five years with sizable increases in general government, public safety, and education. Expenditures expanded by an estimated 25 percent to \$221 million in 1975, paced by further growth in public safety

(+45 percent) and in education (+17 percent). These increases were necessary to meet the additional demand for services resulting from the continued influx of non-residents seeking employment in the rapidly expanding economy.

State Government general fund revenues followed a steady up-trend during the five year period, excluding the \$900 million North Slope lease sale. Tax revenues were up 47 percent from \$74 million in FY 70 to \$109 million in FY 74, including a 73 percent jump in

CHART XIX  
STATE GOVERNMENT GENERAL FUND  
REVENUES & EXPENDITURES  
(FISCAL YEAR 1970-1976)

Source: Annual Financial Report, State of Alaska  
\*1976 - Division of Economic Enterprise estimates

receipts from the Federal Government. During 1975 total general fund revenues increased 39 percent to \$589 million. Taxes were sharply higher, with individual income taxes up 77 percent to \$87 million while corporation income taxes more than doubled to over \$17 million. Revenues from State sources only (unrestricted revenues) increased 29 percent to \$334 million. Total restricted revenues; federal grants in aid and intergovernmental transfers, increased 53 percent to \$255 million.

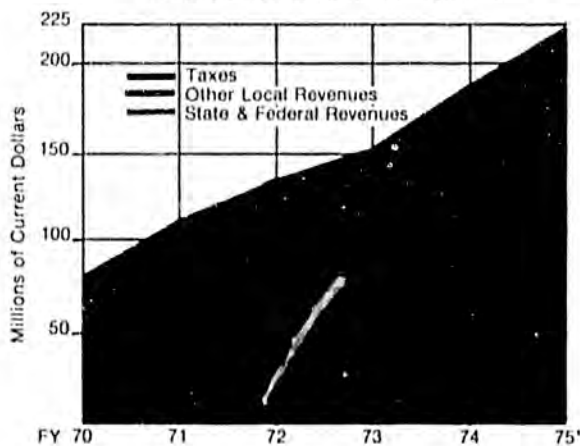

Estimates for 1976 point to substantial growth in unrestricted revenues. Major increases are forecasted in individual income taxes (+29 percent) and corporation income taxes (+47 percent). Total unrestricted revenues, excluding revenues from the tax on oil and gas reserves in place, are estimated to reach \$357 million for an increase of 7 percent. Inclusion of the revenues from the tax on oil and gas in place raises total unrestricted revenues to \$569 million (+71 percent). Restricted revenues during FY 76 are expected to demonstrate sizable increases through additional Federal funds in highway construction programs.

During FY 75 total general fund expenditures increased dramati-

cally, particularly from revenues received and expended from the Federal Government (up 53 percent). State expenditures are forecasted at \$610 while revenues should approximate \$593 million, excluding federal funds. Although sizable gains in State revenues are forecasted, the overall State's financial picture remains cloudy because of the uncertainty of the tax on oil and gas in place, estimated at \$212 million for 1976.

Additional revenue options still remain available to the State of Alaska in the form of additional oil and gas lease sales, sale of royalty oil and gas, and/or additional tax legislation. One source with promise is the proposed lease sale in the Beaufort Sea. Currently this sale is planned for mid-1976 and could bring substantial revenues to the State at that time.

# Area Profiles

## Anchorage

Although it includes nearly half of the State's population, the Anchorage area is the least typically Alaskan community within the State. A metropolitan city, it comprises high-rise office buildings, suburbs filled with ranch style homes, large department stores, two universities, and traffic jams. The area's very size, of over 160,000 persons, provides the base of support for a broad, diverse economy which serves as the commerce center of Alaska. Located in Anchorage are the headquarters of the petroleum and minerals exploration companies which have been attracted by the State's natural resources. These two factors have ensured the area's economic participation in the rapid expansion associated with the construction of the oil pipeline. It has been said that Anchorage is becoming the "Houston of Alaska".

### Historical Perspective

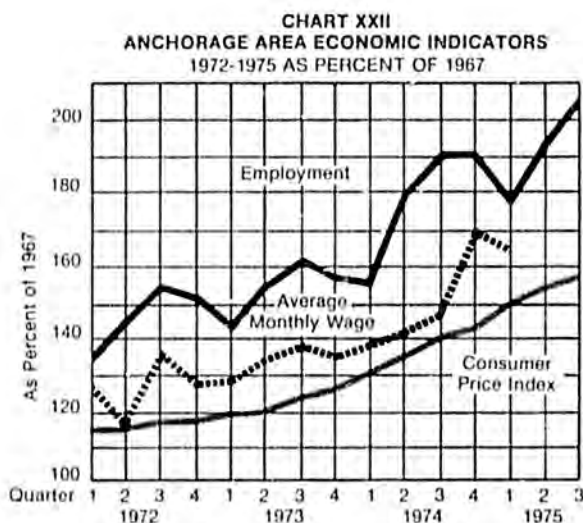

One of the younger Alaskan cities, Anchorage was known as Ship Creek Landing until 1915 when the location was chosen to serve as a supply base for the construction of the federal Alaska Railroad from Seward to Fairbanks. By the spring of 1915, railroad construction attracted a population of 2,000, living in tents

and log houses. The headquarters of the railroad was transferred to Anchorage in 1917 and by 1920 the city was incorporated.

Anchorage's role as a transportation service and support point on the southern end of the "Railbelt" continued until the Second World War, but with little increase in the population or level of economic activity. An important turning point in Anchorage's history occurred with the entry of the United States into the war against the Japanese. A sudden awareness as to the strategic military position of Alaska led to the hurried establishment of Army ground and Air Corps installations, adjacent to Anchorage. With the addition of personnel at these bases, the area population jumped from slightly over 4,200 in 1939 to more than 32,000

by 1950. Thus the Federal Government not only contributed to the creation of Anchorage, but also elevated it to the position of the largest community in the State. The number of defense personnel — military and civilian — was further expanded during the 1950's, and at the same time appreciable growth occurred in the distributive industries.

The decade of the sixties saw the Anchorage metropolitan area developed with a population of over 126,000. Much of the growth was attributable to the development and production of oil and

Sources: U.S. Department of Labor (consumer price index)  
Alaska Department of Labor (employment, wages).

gas reserves in the Cook Inlet basin. Other factors included the general growth in the economy of the remainder of the State, the greatly increased utilization of the Port of Anchorage following the 1964 earthquake which destroyed the port facilities of Seward and Valdez, the opening of offices by the petroleum corporations involved in the Prudhoe Bay development, steady uptrends in tourism, and rapidly rising use of Anchorage International Airport as a refueling point for international trans-polar flights.

### Recent Trends

Economic expansion in the Anchorage area set the pace for development throughout the State since 1970. Although the

population grew only 21 percent between 1970 and 1974, the labor force increased over 41 percent and non-agricultural wage and salaried employment rose 40 percent. However, unemployment also increased as a proportion of the labor force; from 6.6 percent the jobless rate advanced to 9.7 percent in 1973, then retreated to 8.7 percent in 1974. Data for the first eight months of 1975 points to a continued uptrend in employment and a further drop in the unemployment rate.

Nearly all major industrial divisions contributed significantly to the growth in non-farm wage and salaried employment. Every industry except mining and government expanded its work force by at least 42 percent by 1974 and in 1975 all segments reported healthy increases. Until early 1974 employment gains reflected a strengthening of Anchorage's support role in the State; more recent growth has been due to the expansion of this role as it related to developments within the mineral industry.

Consistent and appreciable annual advances within finance-real estate-insurance lifted employment in that industry by 58 percent as of 1974 and initial data for 1975 points to an additional

gain of ten percent. Virtually all major financial institutions operating in the State are headquartered in Anchorage, making it the financial capital of Alaska. Although information on assets and liabilities of banks is available only on a Statewide basis, indications are that increases of deposits and total assets for Anchorage banking facilities have been significant.

Many trade and service establishments opened or expanded during the past five years. In the service industries, employment jumped from 6,450 to 10,100 up 57 percent by 1974 and approached 11,000 in 1975. Wholesale and retail trade employment rose 42 percent by 1974, for an annual average of 12,250. Growth rates in both the trade and service industries accelerated in 1974 and 1975, as the result of direct and indirect effects of the oil pipeline construction and other activities of the mining industry. Wholesale trade, in particular, matured in terms of the size (economies of scale), introduction of more mechanized and efficient warehouses and equipment, and diversification by the firms within the industry.

The largest relative increase was noted in construction, where employment climbed over 40 percent in 1974 and continued up-

ward in 1975. The past two years saw high levels of activity in commercial and residential construction. The value of building permits for the Greater Anchorage Area Borough and the City of Anchorage rose 25 percent over the year to nearly \$162 million in 1974, including gains of 13 percent in commercial and 38 percent in residential construction. Preliminary data for 1975 indicated a growth of nearly 40 percent in both residential and commercial construction. Heavy demands imposed by the oil pipeline project upon the transportation industry served to hike employment in the transportation-communications-utilities sector by over 20 percent in 1974 and by approximately the same rate in 1975. Air transportation experienced the most significant gains, as reflected by increases in the volume of air freight of about 38 percent for each of the past two years. The Port of Anchorage handled 2.3 million tons (+12 percent) in 1974 and 2.0 million tons during the first nine months of 1975 (+26 percent).

The mining industry registered moderate losses each year between 1970 and 1973, reflecting the retrenchment of petroleum when the oil pipeline project failed to obtain the necessary federal authorizations to proceed. A sharp reversal occurred in 1974, with mining employment climbing 40 percent, due to expanded staffs with the petroleum companies and also a substantial increase in mineral exploration. During 1975 mining employment again rose at around 40 percent as new exploration and other field services firms operating in Alaska used Anchorage as their base and when several oil companies enlarged their headquarters space and staff.

Activity in the small manufacturing sector grew at a steady pace from 1970 through 1975. Most of the increase was attributable simply to expansion of the community. Food and kindred products accounted for a majority of the five year gains and concrete products moved upward since 1974, paralleling the trend in construction. Since 1970 there was also a general diversification of the sector as new industries came into existence and other product markets were expanded.

A largely hidden, but important factor, influencing Anchorage's growth has been the tourism industry. In the past five years, more than 1,000 beds have been added to Anchorage hotels to meet the influx of pleasure and business travelers.

Civilian government employment rose at a moderate 23 percent over a four year span; in 1975 the annual increase was roughly six percent. State and local governmental units expanded services and employment at a relatively greater rate than the Federal Government. Federal Government continued, however,

to account for over half of total government employment and exceeded 10,000 in 1975.

With petroleum development dominating both the short-term and long-run future, the Anchorage area appears destined to lead the State in economic growth. On the near horizon, exploitation of oil and gas reserves beneath the Gulf of Alaska's outer continental shelf will surely contribute to this growth. Looking farther into the future, the construction of the new capital city will be a stimulant to Anchorage's expansion. The city may well be near enough for Anchorage to provide the bulk of support services, at least in the early years.

Even without these important developments, the Anchorage economy is at a stage where future growth seems assured.

# Fairbanks

Fairbanks sprang up during the colorful gold rush period and retained much of its unique Alaska character and atmosphere until the recent pipeline boom. Indeed, a major concern of many old-time residents of the community has related to the diluting effect of the mass influx of outsiders upon this community flavor.

## Historical Perspectives

An Italian by the name of Felix Pedro is credited with founding Fairbanks when he discovered gold north of the present site of the city in 1902. Shortly thereafter

the sternwheeler of Captain E. T. Barnette grounded on a sandbar in the nearby Chena River. Barnette settled at that spot, opening a trading post which served the thousands of prospectors which thronged to the area as the word of the discovery spread. The area population reached an estimated 11,000 in 1910 but declined sharply during the following decade to about 2,000 and remained at that level through the 1930's.

Although gold prompted the establishment of Fairbanks, its importance to the area's economy was short-lived and Fairbanks was saved from the fate of most

mining "boom towns" by becoming the transportation hub of Interior Alaska. It achieved this position due to its location near the confluence of the Chena and Tanana Rivers, and by being the northernmost terminus of the Alaska Railroad, completed in 1923.

The large expansion of the military presence in Alaska was the key factor in the growth of Fairbanks during the decades of the 1940's and 1950's. As early as 1938 construction of an Army Air Corps base was underway close to Fairbanks. The outbreak of World War II and the capture of

several Aleutian Islands by the Japanese led to the hurried construction in 1943 of Eielson Air Field, south of Fairbanks, and the Alcan Highway, which ended at Fairbanks and was the first land route to connect Alaska with the "lower 48" states.

The population rose to 19,400 by 1950 and then to 43,400 in 1960. Growth during the period 1950-1970 also resulted from the increased importance of the transportation and other support industries in serving the Interior and a higher level of government services, including a marked rise in enrollment at the University of Alaska. The discovery of the huge petroleum reserves on the North Slope in the late 60's represented a new factor in the area's

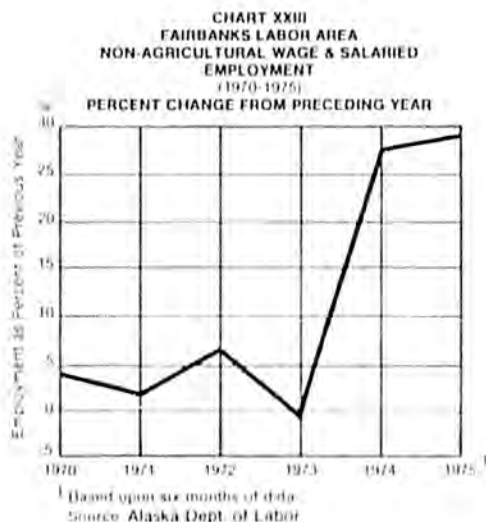

economy, one which exerted moderate influence on the economy until 1974 when the start of oil pipeline construction impacted tremendously upon socio-economic conditions within the Fairbanks area.

### Current Trends

Although initial hiring for the pipeline construction project began in mid-1974, the employment peak was not reached until the summer of 1975. Since only a small proportion of pipeline employees actually are employed in the Fairbanks area, the project's impact upon the community has been largely indirect. The growth in total employment exceeded, by an unexpected margin,

the increase in unemployment, permitting a decline in the jobless rate on an annual basis to less than eight percent of the labor force. Non-agricultural wage and salaried employment attained an all-time high in 1975, up nearly 30 percent from the 1974 average, as the result of a doubling in the level of construction activity plus strong advances in most support industries, specifically trade, services, and transportation.

Both residential and commercial construction were at unusually high levels for the second consecutive year, boosted by the petroleum industry and, to a lesser extent, by investments of Native corporations. Commercial construction was bolstered by

work on a sizable number of warehouses for petroleum and related support companies and by new or expanding non-manufacturing establishments, such as motels, restaurants and airline companies. The largest project for which a permit was issued by the North Star Borough was a \$35 million power generating plant. Residential construction was also strong, with most permits for single unit dwellings.

Transportation-communications-utilities employment increased around 45 percent in 1975, due to heavy demands placed upon trucking and air transportation facilities by the pipeline project. Additionally,

revenue tons transported by the Alaska Railroad were up roughly 50 percent. The trucking and warehousing component experienced a doubling of employment during the peak summer season.

Job holding in trade and services grew around 20 percent between 1974 and 1975. Wholesale trade, general merchandise and apparel, and eating and drinking places shared in the rise in trade. Within the services division, notable gains were reported for lodging and health services.

Moderate advances took place in mining and finance-real estate-insurance employment. In the government sector, state agencies expanded appreciably in

order to provide the services required by the large influx of new residents and migrants. Employment in local government rose in response to the impact of the pipeline project and also the transfer of employees from the state-operated schools system.

Despite the sharp downturn anticipated in pipeline activity in the last quarter, the Fairbanks area economy should fare well during 1976. Local construction, particularly commercial, will be the mainstay of growth for at least one more year. Any lessening of the frantic growth rate, and accompanying social problems, of 1974 and 1975, will be surely a welcome change to many of the area's citizenry.

## INTRODUCTION

Employment estimates contained in this publication are computed on a Labor Force basis. This procedure reflects employment figures according to place of residence, counting employed persons only once. Conceptually, this method brings the State and area data closer to the national figures derived from the monthly Current Population Survey.

Nonagricultural wage and salary employment by industry is still being compiled and published in the same way it has in the past. Because these figures are useful in economic analyses, they will continue to provide a historically consistent series of industry employment by place of establishment.

There are two tables for each area. The first shows total civilian labor force, the two components of labor force, total employment and unemployment, and the unemployment rate. The unemployment rate is the percentage of the civilian labor force that is unemployed. The total employment figures include self-employed persons, unpaid family workers, domestics, agricultural workers, and workers directly involved in work stoppages, as well as nonfarm wage and salary employment adjusted for multiple job holding and commuting. The contents of this table are on a place of residence basis.

The second table shows nonagricultural wage and salary employment by place of establishment subdivided into major industry division.

The source of most of the employment data is the contribution reports filed quarterly by most employers in the State in compliance with the Alaska Employment Security Act as well as reports filed by federal agencies under the federal unemployment insurance program. State and local government employment was available from reports which these government units send to the Employment Security Division under the Current Employment Statistics program conducted in cooperation with the Bureau of Labor Statistics of the U.S. Department of Labor.

In certain categories of noncovered employment, employer sources of data do not exist on a continuous reporting basis. For these categories employment estimates were prepared from projections of the 1970 Census figures and from special surveys.

The techniques used in estimating unemployment and in adjusting establishment employment data to a place of residence basis are those prescribed by the Bureau of Labor Statistics. Unemployment estimates include all jobless persons looking for work, regardless of whether or not they qualify for unemployment insurance benefits.

All of the figures for individual labor areas are unrounded even where the figures are estimates. The decision to publish unrounded figures was dictated by convenience rather than confidence that the estimates are accurate to the one digit level. All figures for the State have been rounded to the nearest hundred.

# Population Estimates and Projections

U S DEPARTMENT OF COMMERCE • Social and Economic Statistics Administration • BUREAU OF THE CENSUS

Series P-25, No. 604

Issued June 1975

## ESTIMATES OF THE POPULATION OF ALASKA CENSUS DIVISIONS AND METROPOLITAN AREAS: JULY 1, 1973 AND 1974

This report presents population estimates for July 1, 1973 and provisional estimates for July 1, 1974 for census divisions and metropolitan areas in Alaska. These estimates were prepared by the Bureau of the Census as part of its continuing population estimates program. They are consistent in methodological approach with county or county equivalent estimates for other States jointly prepared by State agencies and the Bureau of the Census under the auspices of the Federal-State Cooperative Program and published in *Current Population Reports*, Series P-26.

Census division estimates for July 1, 1971, July 1, 1972, and provisional estimates for July 1, 1973, were published earlier in *Current Population Reports*, Series P-25, Nos. 517 and 531. The provisional estimates in the last cited report are superseded by the numbers published here.

This report introduces an additional estimating procedure using administrative records, made possible by the availability of a new data source. Because of the resultant change in weighting of methods and changes in input data in other methods used, estimates shown here may not always be comparable with those for the earlier years.

The methods used have been tested against the 1970 census and recent special censuses. A decision on current methodology was made by the Bureau of the Census on the basis of the tests. For a more detailed description of the Federal-State Cooperative Program and an analysis of 1970 test results for methods other

than the recently developed Administrative Records method, see *Current Population Reports*, Series P-26, No. 21, "Federal-State Cooperative Program for Local Population Estimates: Test Results—April 1, 1970," April 1973. Results of a test of the Administrative Records method are presented in *Current Population Reports*, Series P-25, No. 547.<sup>1</sup>

The estimates shown for July 1, 1973, are based on an average of the following methods, adjusted to agree with the July 1, 1973 State estimate published in Series P-25, No. 533.

1. The Regression (ratio-correlation) method. In the Regression method a multiple regression equation is used to relate changes in a number of different data series to change in population distribution.<sup>2</sup> The series of data used in the Regression method for Alaska are: elementary school enrollment in grades 1 through 8 plus elementary special and elementary ungraded ( $X_1$ )

<sup>1</sup> Results of earlier studies were given in "Use of Administrative Records for Small-Area Population Estimates," by Meyer Zitter and David L. Word; a paper presented at the Annual Meeting of Population Association of America, New Orleans, Louisiana, April 27, 1974. A copy of this paper can be obtained by writing Chief, Population Division, Bureau of the Census, Washington, D.C. 20233.

<sup>2</sup> Descriptions of methodologies are given in *Current Population Reports*, Series P-25, Nos. 427 and 520. Modifications made to the methodologies for the current series will be given in forthcoming reports in Series P-25.

and three-year averages of resident births ( $X_2$ ). The prediction equation for Alaska for the 1970's is given by

$$\hat{Y} = 0.2087 + 0.5125X_1 + 0.3309X_2$$

**2. Component Method II.** This method employs vital statistics to measure natural increase and school enrollment to measure net migration. The estimates made by the Census Bureau's Component Method II are specific to the civilian population under 65. To this population is added an estimate of the population 65 and over based on Medicare statistics and an estimate of the resident military population based on station strength statistics.<sup>2</sup>

**3. The Administrative Records method.** This newly developed component method uses administrative records (in this instance individual Federal income tax returns) to measure civilian intercounty migration and reported vital statistics to estimate natural increase.<sup>3</sup> The tax returns are matched for the successive periods to determine the number of persons whose county of residence changed during the estimating period. A net migration rate based on the number of taxpayers changing residence is derived; this rate is then assumed to apply to the total population. This estimate is made specific to the civilian population under age 65 by excluding from the migration computations data relating to persons 65 years and over. These estimates are then combined with independent estimates of the population 65 and over based on Medicare statistics. The other components of population change—births, deaths, immigration, net movement between the Armed Forces and civilian population, and resident military population—are identical with Component Method II (described above).

The provisional July 1, 1974 estimate for Anchorage Census Division was developed by adding the average change between 1973 and 1974 estimates based on Component Method II and the Housing Unit method to the 1973 estimate. In the Housing Unit method the estimates of the population are based on

estimates of the housing inventory. Changes in the housing inventory are derived from data on building permits issued and demolition records, or on data on electric meter connections. The provisional July 1, 1974 estimates for the remaining census divisions were developed by adding the change between 1973 and 1974 Component Method II estimates to the 1973 estimates. All census divisions were subsequently adjusted to agree with the provisional July 1, 1974 State estimate published in **Current Population Reports**, Series P-25, No. 533.

Table 2 of this report presents estimates of the population of metropolitan areas and metropolitan census divisions in the State. The titles and definitions of the standard metropolitan statistical areas (SMSA's) are those currently defined by the Office of Management and Budget, Executive Office of the President.

The 1973 estimates published in this report represent revisions to census division estimates shown in **Current Population Reports**, Series P-25, No. 547. They reflect more current data on population change than were available at the time that the Series P-25 report was prepared. The estimates for census divisions, incorporated places, and other general purpose governments published in the Series P-25 report were used as the basis for the distribution of funds under the State and Local Fiscal Assistance Act of 1972. See that report for a description of methods, assumptions, and limitations of the estimates.

Corresponding estimates for other States in the program will be published as they become available. The appendix table shows reports published to date for States in the 1973-74 series, together with those published earlier in the decade.

The 1970 census total for the State shown on the table may differ slightly from the sum of the census divisions because of corrections made subsequent to the release of the official State figure. All census division populations for 1970 reflect the most recent corrections in the census count. The only census division with a correction of more than 500 is Anchorage.

<sup>2</sup>See footnote 2 on page 1.

<sup>3</sup>For a discussion of this methodology see Donald E. Starsinic, "Development of Population Estimates for Revenue Sharing Areas," in U.S. Bureau of the Census, **Census Tract Papers**, Series GE-40, No. 10; and Zitter and Word, *op cit*.

The estimates presented in the table have been rounded to the nearest hundred without being adjusted to the State total, which was independently rounded to the nearest thousand. Percentages are based on unrounded numbers.

**Table 1. ESTIMATES OF THE POPULATION OF ALASKA CENSUS DIVISIONS:  
JULY 1, 1973 AND JULY 1, 1974**

(State estimates are shown to the nearest thousand, census division estimates to the nearest hundred)

Z Less than 50 persons or less than 0.05 percent.

<sup>1</sup>Total does not agree with the sum of the census divisions due to corrections made to the census division populations after release of the official State counts.

<sup>2</sup>Births and deaths are based on reported vital statistics from April 1, 1970, to December 31, 1973, with extrapolations to June 30, 1974. Net migration is the difference between net change and natural increase.

**Table 2. ESTIMATES OF THE POPULATION OF METROPOLITAN AREAS AND THEIR  
COMPONENT CENSUS DIVISIONS: ALASKA, JULY 1, 1973 AND 1974**

(SMSA totals rounded independently of census division numbers)

Standard metropolitan statistical area and census division	July 1, 1974 (provi- sional)	July 1, 1973	April 1, 1970 (census)	Change, 1970 to 1974		Components of change, 1970 to 1974 <sup>1</sup>			
				Number	Percent	Births	Deaths	Net migration	
								Number	Percent
ANCHORAGE.....	148,800	145,800	126,385	22,400	17.8	13,200	2,100	11,400	9.0
Anchorage.....	148,800	145,800	126,385	22,400	17.8	13,200	2,100	11,400	9.0

<sup>1</sup>Births and deaths are based on reported vital statistics from April 1, 1970, to December 31, 1973, with extrapolations to June 30, 1974. Net migration is the difference between net change and natural increase.

## APPENDIX

Peter Keating, Manpower Economist

## INTRODUCTION

Population estimating in the United States is really population forecasting because the annual estimates are simply adjustments to the Census conducted by the U.S. Department of Commerce every ten years. J.E. Morton of the Upjohn Institute for Employment Research pointed out in On Manpower Forecasting that, "All forecasting efforts, by whichever method, have one element in common: the search for relative stabilities and invariances of relationship. However complex the resulting methods and models, their forecasting powers stand and fall with the validity of the assumed or implied invariance".

Since 1971 the State of Alaska has been preparing population estimates based on two widely used methodologies in which civilian in- or out-migration is determined to be proportional to cohort school enrollment fluctuations over time. In many areas of the nation school enrollment is the best indicator for population shifts because none can deny the relationship between increases in children attending public schools in an area and the corresponding total population increase.

In Alaska, however, this assumption of constancy can not be so easily made. According to the North Star Borough's "Pipeline Impact Information Center Report Number Thirteen" dated February 19, 1975, "During the one-month period from December 30, 1974 through February 1, 1975, Bechtel, Inc. processed 1,575 pipeline workers through the Fairbanks orientation center. Of those, 31 said they intend to bring their families, which include a total of 58 school-age children, to Fairbanks to live. These figures show that for every 26.5 pipeline workers hired during the current survey period, one school-age child would be brought into the local school system". There is no way to accommodate this relationship with the present estimating techniques used for the State in general and the North Star Borough in particular.

The art of population estimating today is in a state of flux. The Bureau of the Census has developed a technique by which administrative records from the Internal Revenue Service are being used to trace sub-country migration patterns. The Bureau has expressed enthusiastic confidence in this new method and hopes to eventually have it replace or at least substantially affect the Federal-State Co-op program estimates. Their work opens up many areas not previously considered available for statistical investigation.

The Research & Analysis Section of the Alaska Department of Labor is now examining alternative multiple regression variables which may more accurately reflect the migration patterns of our State. Coordination with other data collection agencies has begun in an effort to consider exactly what population indicators can meet Mr. Morton's definition for relationship invariance.

In order to affect officially accepted estimates of Alaska's population, any new methodology proposed must be approved by the Population Division of the Bureau of Census. This is one of the goals of our endeavor. The main goal is to develop the most accurate estimating technique for an atypical population of Alaska.

## METHODOLOGY

The methodology used for Alaska's July 1, 1974 census divisional estimates was basically the same one employed for the previous three annual estimates with one exception. The method involved (1) subtracting Armed Forces from the 1970 Census count to arrive at an estimate of the April 1, 1970 civilian population; (2) adding to this civilian population an estimate of births for the period between the census and the estimate date; (3) subtracting an estimate of civilian

deaths; (4) adding an estimate of net civilian migration, and (5) adding an estimate of the number of persons in the Armed Forces stationed in the State. The exception was that the practice of adjusting the derived estimates to Census Bureau control totals was discontinued.

The estimate of net civilian migration for each census division was prepared by the Census Bureau's Component Method II. The basic steps involved in the estimation of net civilian migration according to this method are as follows: (1) Net migration rates for children between exact age 6 1/4 and exact age 14 1/4 years at each estimate date were developed on the basis of the 1970 Census and statistics on school enrollment in grades one through eight. (2) These rates were multiplied by a factor to obtain the estimated migration rate for the total population suggested by the Bureau of Census based on the age structure of intercounty migrants. (3) The resulting rates were applied to the civilian population of all ages (adjusted by one-half the births since 1970) in each census division in 1970 to obtain tentative estimates of net civilian migration for the period since 1970.

#### SOURCES OF DATA

The data used to develop the population estimates contained in this publication were obtained from other State and Federal agencies. Vital statistics were supplied by the Alaska Department of Health and Social Services, Division of Statistical Services. School enrollment data were provided by the Alaska Department of Education and the Bureau of Indian Affairs. The Alaskan Command and United States Coast Guard supplied figures relating to the Armed Forces stationed in Alaska.

**ALASKA  
LABOR FORCE  
ESTIMATES  
BY INDUSTRY & AREA**

**1974**

## INTRODUCTION

Employment estimates contained in this publication are computed on a Labor Force basis. This procedure reflects employment figures according to place of residence, counting employed persons only once. Conceptually, this method brings the State and area data closer to the national figures derived from the monthly Current Population Survey.

Nonagricultural wage and salary employment by industry is still being compiled and published in the same way it has in the past. Because these figures are useful in economic analyses, they will continue to provide a historically consistent series of industry employment by place of establishment.

There are two tables for each area. The first shows total civilian labor force, the two components of labor force, total employment and unemployment, and the unemployment rate. The unemployment rate is the percentage of the civilian labor force that is unemployed. The total employment figures include self-employed persons, unpaid family workers, domestics, agricultural workers, and workers directly involved in work stoppages, as well as nonfarm wage and salary employment adjusted for multiple job holding and commuting. The contents of this table are on a place of residence basis.

The second table shows nonagricultural wage and salary employment by place of establishment subdivided into major industry division.

The source of most of the employment data is the contribution reports filed quarterly by most employers in the State in compliance with the Alaska Employment Security Act as well as reports filed by federal agencies under the federal unemployment insurance program. State and local government employment was available from reports which these government units send to the Employment Security Division under the Current Employment Statistics program conducted in cooperation with the Bureau of Labor Statistics of the U.S. Department of Labor.

In certain categories of noncovered employment, employer sources of data do not exist on a continuous reporting basis. For these categories employment estimates were prepared from projections of the 1970 Census figures and from special surveys.

The techniques used in estimating unemployment and in adjusting establishment employment data to a place of residence basis are those prescribed by the Bureau of Labor Statistics. Unemployment estimates include all jobless persons looking for work, regardless of whether or not they qualify for unemployment insurance benefits.

All of the figures for individual labor areas are unrounded even where the figures are estimates. The decision to publish unrounded figures was dictated by convenience rather than confidence that the estimates are accurate to the one digit level. All figures for the State have been rounded to the nearest hundred.
